ETHYL ALCOHOL

SPECIFIC GRAVITY OF MIXTURES OF ETHYL ALCOHOL AND WATER BY VOLUME AND BY WEIGHT

Giving the specific gravity at 15.56° C. referred to water at the same temperature. To reduce to specific gravity referred to water at 4° C. multiply by 0.99908.
(U. S. Department of Agriculture.)

Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.	Specific gravity.	Per cent alcohol by volume.	Per cent alcohol by weight.	Grams alcohol per 100 c.c.

Calculation of the percentage of ethyl and methyl alcohols in a mixture with water, assuming a distillate to have a sp. gr of 0.97917 $\frac{15.56^\circ}{15.56^\circ}$ and a refraction of 30.0 at 20° on the immersion refractometer. — From the tables of sp. gr for these alcohols the density is found to correspond to 13.70% and 12.83% by weight of ethyl and methyl alcohol respectively; from the table above, the refractometer readings corresponding to 13.70% ethyl and methyl alcohol are 38.16 and 22.42 respectively. Then $(38.16 - 30.0) / (38.16 - 22.42) \times 100 = 51.8\%$, or 51.8% of the alcohol in the distillate is methyl alcohol.

$(12.83 \times 0.518) + 13.70 \times (1 - 0.518) = 13.25$ which is the % by weight of the mixed alcohols in the distillate, of which 13.25×0.518 or 6.86% is methyl alcohol and $13.25 \times (1 - 0.518)$ or 6.39% is ethyl alcohol

DENSITY OF VARIOUS SOLIDS

The approximate density of various solids at ordinary atmospheric temperature.

In the case of substances with voids such as paper or leather the bulk density is indicated rather than the density of the solid portion.

(Selected principally from the Smithsonian Tables.)

Substance	Grams per cu. cm	Pounds per cu. ft.	Substance	Grams per cu. cm	Pounds per cu. ft.

Physical Properties of Common Woods

DENSITY OF WATER

The temperature of maximum density for pure water, **free** from air = **3.98° C.**

The density at this temperature = **0.999973 g/cm³.**

The density of water at 3.98° C is 1.000000 g/ml.

(International Bureau of Weights and Measures, 1910.)

HYDROMETERS AND DENSITY UNITS

Alcoholometer. — For testing alcoholic solutions; the scale shows the per cent of alcohol by volume; 0°–100° is the per cent.

Ammoniameter. — For testing ammonia solutions; scale 0°–40°; to convert to sp. gr. multiply by 3 and deduct from 1000.

Barkrometer or Barkometer. — For testing tanning liquor; scale 0°–80° Bk; the number to the right of the decimal point of the sp. gr. is the degree Bk; thus, 1.025 sp. gr. is 25° Bk.

Baumé. — There are two kinds in use; heavy Bé, for liquids heavier than water and light Bé for liquids lighter than water. In the former, 0° corresponds to a sp. gr. 1.000 (water at 4°C.) and 66° corresponds to a sp. gr. 1.842; in the lighter than water scale, 0° Bé is equivalent to the gravity of a 10% solution of sodium chloride and 60° Bé corresponds to a sp. gr. of 0.745. For Baumé degrees on the scale of densities greater than unity, the following equation gives the means of conversion:

$$\text{Sp. gr.} = \frac{m}{m - d} \text{ where } m = 145 \text{ (in the United States)} \\ m = 144 \text{ (old scale used in Holland)} \\ m = 146.78 \text{ (New scale or Gerlach scale)} \\ d = \text{Baumé reading}$$

Beck's Hydrometer has 0° corresponding to sp. gr. 1.000 and 30° to sp. gr. 0.850; equal divisions on the scale are continued as far as required in both directions.

Brix Saccharometer or Balling Saccharometer shows directly the per cent of sugar (sucrose) by weight at the temperature indicated on the instrument, usually 17.5°C.; i.e., degrees Brix is the per cent sugar.

Cartier's Hydrometer floats in water at the 10° scale division and at 30° corresponds to 32° Bé.

Oleometer. — For vegetable and sperm oils; scale 50°–0° corresponds to sp. gr. 0.870–0.970.

Soxhlet's Lactometer, for determining the density of milk, has a scale from 25° (sp. gr. 1.025) to 35° (sp. gr. 1.035) divided into suitable scale divisions.

Twaddell Hydrometers have the scale so arranged that the reading multiplied by 5 and added to 1000 gives the sp. gr. with reference to water as 1000; it is always used for densities greater than water.

RELATIVE DENSITY AND VOLUME OF WATER

The mass of one cubic centimeter of water at 4° C is taken as unity.
The values given are numerically equal to the absolute density in grams per milliliter.

DENSITY OF MOIST AIR

The density of dry air may be determined by computation from the general relation $D = D_0(T_0/T)(P/P_0)$ where D_0 represents a known density at absolute temperature T_0 and pressure P_0 and D , the density at absolute temperature T and pressure P .

The density of moist air may be determined by a similar relation:

$D = 1.2929 (273.13/T) [(B - 0.3783e)/760]$ where T is the absolute temperature; B , the barometric pressure in mm, and e the vapor pressure of the moisture in the air in mm. The density will then be the product of two terms, each of which may be found by use of the tables which follow.

The first factor, $1.2929 (273.13/T)$, may be found directly in Table I for various temperatures. For convenience, temperatures are given in the table in °C although the values of the factor have been computed with absolute temperatures. The tabular values actually represent the density of dry air at various temperatures and 760 mm pressure.

The second factor, $[(B - 0.3783e)/760]$, must be obtained in two steps: **First**—the numerator of the expression is obtained by subtracting $0.3783e$ from the barometric pressure. The quantity $0.3783e$ may be found directly from the dew point in Table II. If the wet and dry bulb thermometer readings are known e may be found in the table Reduction of Psychrometric Observations given in the section Hygrometric and Barometric Tables. $0.3783e$ may then be found by calculation or read from the table. **Second**—the value of the whole factor for any value of $B - 0.3783e$ may be obtained from Table III.

The product of the above two factors will give the required density in g/l.

To facilitate obtaining approximate values of the density for ordinary pressures and temperatures, a table of products is given which may be entered with the temperature in °C and the corrected (for moisture) value of the barometric pressure in mm to obtain density.

As an illustration of the use of the tables, let it be desired to find the density of air for a barometric pressure of 750 mm, a dew point of 10° C, and air temperature of 20° C.

From the dew point, the value of $0.3783e$ is found in Table II to be 3.48 mm. $750 - 3.48 = 746.52$, the corrected pressure. The pressure factor for this value found in Table III by interpolation is 0.98226.

The temperature factor from Table I is 1.2047.

$$1.2047 \times 0.98224 = 1.1833 \text{ g/l.}$$

To obtain the value directly from Table IV, enter it for 20° C and 746.5 mm which gives by interpolation 1.183 g/l.

TABLE I

$$(1.2929 \times 273.13/T)$$

(Besides being a necessary part of the determination of the density of moist air, the values in this table are actually the density of dry air in g/l at 760 mm pressure for various temperatures.)

DENSITY OF MOIST AIR (Continued)

TABLE III

Pressure Factor.— $[(B - 0.3783e)/760]$

The figures in the body of the table give values of the whole term $(B - 0.3783e)/760$ for various values of the numerator $(B - 0.3783e)$ expressed at the left and top.

TABLE IV

Density of Moist Air

Values in the body of the table give the density of moist air in g/l for a limited range of temperatures and corrected pressure values ($B = 0.3783e$). The latter may be obtained by use of Table II.

°C	600	610	620	630	640	650	660	670	680	690

ELASTIC CONSTANTS FOR SOLIDS

The following table gives values for the yield point (or elastic limit, indicated by e), ultimate tensile strength, Young's modulus and the modulus of rigidity in kg/mm². The Brinell hardness number is also given, representing the ratio of load in kilograms on a sphere used to indent material to the spherical area of the indentation in square millimeters.

YIELD POINT, TENSILE STRENGTH, BRINELL HARDNESS

Material	Yield point		Ultimate tensile strength		Brinell hardness number
	Kg/mm ²	Lbs./in. ²	Kg/mm ²	Lbs./in. ²	
Aluminum 99.97, annealed.	×10 ³	5 96	×10 ³	16
99.5, cast	7 95	8 48
hot rolled	10 2	14 51	11 34	11 31
cold "	13 2	18 77	14 71	16 13
99.3, rolled	19 7-24 6	28 02-34 90	39

ELASTIC CONSTANTS FOR GASES

For short ranges of pressure, at a constant temperature, the volume of a gas is inversely proportional to the pressure or pressure \times volume = a constant. (Boyle's Law.)

For high pressures, the table below shows the relative volumes at various temperatures. The volume at 0° C. and 76 cm. pressure (1 atmosphere) being taken as 1,000,000.

(From Smithsonian Tables.)

SURFACE TENSION

Compiled by T. Fraser Young and William D. Harkins

MEANING OF SYMBOLS

γ = the surface tension in dynes per centimeter.

$\Delta\gamma$ = the surface tension of a solution minus the surface tension of the pure solvent.

-- air, means that the liquid was in contact with air (saturated with its own vapor).

-- vapor, means that the liquid was in contact with its own vapor.

-- N_2 and -- H_2 have corresponding meanings.

-- also designates the surface between a pair of liquids at which the interfacial tension was determined.

γ_c = weight % of the solute (i. e. the organic substance).

f = gram formula weights per 1000 grams of solvent (i. e. water).

$^{\circ}C$ = degrees Centigrade.

$^{\circ}K$ = degrees Kelvin or Absolute. Temperature in $^{\circ}C$ = Temperature in $^{\circ}K - 273.1$.

M.P., at the melting point.

k_E = the Eötvös Constant, in erg mole⁻¹ degree⁻¹.

$$-k_E = \frac{d \Gamma}{d t} = \frac{d (M/d)^{\frac{2}{3}} \gamma}{d t}$$

where $\Gamma = \gamma (M/d)^{\frac{2}{3}}$

M = mass of one gram formula weight of the substance

d = density of the substance.

AQUEOUS SOLUTIONS AGAINST AIR

INORGANIC

(f = gram formula weights per 1000 grams of solvent.)

For the following aqueous solutions the values of $\Delta\gamma$ are given. $\Delta\gamma$ is the difference between the surface tension of the solution and that of the solvent at the same temperature. Positive values of $\Delta\gamma$ mean that the surface tension of the solution is greater than that of the solvent. Negative values, the reverse. For convenience in computing the surface tension, the current accepted value for the surface tension of water at the stated temperature is given in the second column.

VISCOSITY

The **viscosity** of a substance is defined as the tangential force per unit area of either of two horizontal planes at unit distance apart, one of which is fixed, while the other moves with unit velocity, the space being filled with the substance.

In the case of a liquid flowing slowly through a long tube of small diameter, the volume V of liquid which escapes in a time t is given by the equation,

$$V = \frac{\pi p r^4}{8 l \eta} t$$

where p is the difference in pressure between the two ends of the tube; r , its radius; l , its length, and η , the viscosity. (Law of Poiseuille.)

A more complete equation is now generally used:

$$\eta = \frac{\pi d g r^4}{8 Q (l + \lambda)} \left(h - \frac{m v^2}{g} \right)$$

where η is the viscosity; d , the density in g/cm³; r , the radius, and l , the length, of the tube in cm; Q , the volume in cm³ discharged in t sec.; λ , a correction to the length of the tube; h , the average head in cm; m , the coefficient of the kinetic energy correction, $m v^2/g$; g , the acceleration due to gravity in cm/sec.²; v , the mean velocity in cm/sec. See Technologic Papers of the Bureau of Standards 100 and 112, 1917 and 1918, for a full discussion.

Viscosity is expressed in dyne-seconds per cm² or poises. The centipoise (cp) is 0.01 poise.

Specific viscosity is the ratio of the viscosity of any substance to that of water at 0° C or other specified temperature. Since the viscosity of water at 20° C is 1.0050 centipoises, the viscosity of any substance expressed in centipoises is approximately equal to its specific viscosity referred to water at 20° C.

Kinematic viscosity is the ratio of the viscosity to the density

Fluidity is the reciprocal of viscosity.

VISCOSITY OF WATER BELOW 0° C

White-Twining, 1914

Temperature	Viscosity centipoises	Temperature	Viscosity centipoises
0° C	1 798	-7 23	2 341
-2 10	1 930	-8 48	2 458
-4 70	2 121	-9 30	2 549

VISCOSITY OF AQUEOUS SUCROSE SOLUTIONS

Bingham and Jackson, Bull. Bur. Stds. 14, 59 (1918-19)

Giving the viscosity in centipoises for 20, 40 and 60% by weight sucrose solutions for each 5° C. from 0 to 100° C. For densities see table Sucrose—Specific gravity of aqueous sugar solutions.

Temp. °C	Viscosity, cp			Temp. °C	Viscosity, cp		
	20 %	40 %	60 %		20 %	40 %	60 %
0	3 804	14 77	238	55	0 884	2 219	11 67
5	3 154	11 56	156	60	808	1 982	9 83

EQUATION FOR THE LINEAR EXPANSION OF SOLIDS

If l_0 is the length at 0°C the length at $t^\circ \text{C}$ is $l_t = l_0 (1 + \alpha t + \beta t^2)$.

The table gives the values of these coefficients.

Substance	Temp limits $^\circ \text{C}$	α	β	Observer
Aluminum	10-90	$.2221 \times 10^{-4}$	114×10^{-7}	Fizeau

Zinc	10-90	.2969	-.0635	Fizeau

CUBICAL EXPANSION OF SOLIDS

The coefficient of cubical expansion for a solid is approximately three times the linear coefficient.

The experimental values for various solids are given in the following table. The coefficient is the increase in volume per unit volume per degree Centigrade.

Substance	Temp ° C	Coefficient	Observer
Antimony	0-100	0.3167×10^{-4}	Matthiessen
Asphalt	5-7		
Beryl	0-100	0.3167	Pfaff

REDUCTION OF GAS VOLUME TO NORMAL CONDITIONS

Factors and their logarithms for reducing a gas volume to normal conditions, 0° C., 760 mm pressure.

The volume of dry gas measured at any temperature 10-35° C. inclusive and pressure 690-784 mm of Hg may be reduced to the volume at 0° C. (273.18° K.) and 760 mm of Hg pressure by multiplying by the factor found in the table.

In case the volume of gas is measured in the presence of water vapor the pressure of the aqueous vapor must be subtracted from the value of the total or barometric pressure before entering the table. In the case of atmospheric air the vapor pressure may be found by determining the dew point or temperature of saturation. The pressure of water vapor may then be read from the small table below. If gas volumes are measured over water, the vapor pressure will be that of saturated aqueous vapor at the temperature used. A table giving the pressure of saturated aqueous vapor over water is given below.

Pressure of Saturated Water Vapor

°C.	mm	°C.	mm	°C.	mm
9	8.6	18	15.5	27	26.7
10	9.2	19	16.5	28	28.3

Heat Capacity of Air-free Water 0°-100°C at 1 Atmosphere Pressure

The heat capacity of air-free water is given in international steam table calories per gram and in absolute joules per gram. (1 absolute joule=0.238846 I.T. Cal.).

The enthalpy or heat content is given for air-free water in I.T. Cal. per gram and in absolute joules per gram.

From Osborne, Stinson and Ginnings, B of S. Jour. Res 23, 238, 1939.

SPECIFIC HEAT AND ATOMIC HEAT OF MERCURY

The specific heat is given in relation to water at 15°C. The atomic heat is the thermal capacity of one gram atom.

Values between -75.6° and -36.7°C. are from Carpenter and Stoodley, *Phil. Mag.* **10**, 249, 1930; from 0-80°C., Barnes-Cooke, from 90-140°C., mean of Winklemann, Naccari and Milthaler, above 140°C., mean of Naccari and Milthaler.

Temp. °C	Specific heat	Atomic heat	Temp. °C	Specific heat	Atomic heat

SPECIFIC HEAT OF SOLID INORGANIC COMPOUNDS

Specific heat is given in calories (15°) per gram per degree Centigrade. To change to joules per gram per degree Centigrade multiply by 4.185.

COLOR SCALE OF TEMPERATURE

This table is the result of an effort to interpret in terms of thermometric readings, the common expressions used in describing temperatures. It is obvious that the values are only approximations.

Color.	Temperature, °C.
Incipient red heat.....	500-550
Dark red heat.....	650-750
Bright red heat.....	850-950
Yellowish red heat.....	1050-1150
Incipient white heat.....	1250-1350
White heat.....	1450-1550

SPECIFIC HEAT

Variation with Temperature

The table gives the true specific heat at the temperatures named. From data of Wüst, Meuthen, and Durrer, 1918.

°C	Pb	Zn	Al	Ag	Au	Cu	Ni	Fe	Co	Quartz

*The data in this table are compiled from various sources,—hence the variations in the melting point of the metals as shown in this column.

MELTING AND BOILING TEMPERATURES

Temperature of Fusion for Various Substances for Atmospheric Pressure

For the melting- and boiling-points of the chemical elements and of inorganic compounds see under Physical Constants of the Elements, and Physical Constants of Inorganic Compounds.

Substance.	Temp. of fusion ° C.	Substance.	Temp. of fusion ° C.
Acetylene.....	-81	German silver..	1000.
Alcohol, ethyl..	-130.	Glass.....	1100.
Brass.....	900.	Glycerine.....	17.
Butter.....	31-31.5	Olive oil.....	2-6
Camphor.....	177.7	Paraffin.....	55.
Caoutchouc,		Resin.....	135.
pure gum....	120.	Sea water.....	-2.5
Chloroform....	-63.2	Sugar (cane)...	160.
Ether.....	-117.6		

Boiling-point for Various Substances

Giving the boiling-point at atmospheric pressure and the variation per cm. pressure near 76 cm.

Substance.	Temp. ° C.	Variation.
Acetone.....	57.	0.39
Acetylene.....	-72.2	
Alcohol, ethyl.....	78.3	0.34
methyl.....	64.7	0.35
Amyl acetate.....	148.	
Benzene.....	80.	0.43
Camphor.....	205.	0.56
Chloroform.....	61.2	0.41
Ether.....	34.6	0.40
Gasoline.....	70-90.	
Glycerine.....	291.	
Turpentine.....	159.	

MELTING POINT OF ICE—VARIATION WITH PRESSURE

(From Tamann, 1900, by permission.)

Pressure in kg. per sq.cm.	Temp. ° C.	Pressure in kg. per sq.cm.	Temp. ° C.
1	0.0	1410	-12.5
336	- 2.5	1625	-15.0
615	- 5.0	1835	-17.5
890	- 7.5	2042	-20.0
1155	-10.0	2200	-22.1

BOILING POINTS OF WATER-ALCOHOL MIXTURES

MOLECULAR ELEVATION OF THE BOILING POINT

(Most values from Hoyt, C.S. and Fink, C.K., Journal of Physical Chemistry, Vol. 41, No. 3., March, 1937.)

Molecular elevation of the boiling point showing the elevation of the boiling point in degrees C due to the addition of one gram molecular weight of the dissolved substance to 1000 grams of any one of the solvents below. The correction in the last column gives the number of degrees to be subtracted for each mm. of difference between the barometric reading and 760 mm.

Solvent	K_B	Barometric Correction per mm.
Acetic acid ..	3.07	0.0008
Acetone .	1.71	0.0004
Aniline. .	3.52	0.0009
Benzene .	2.53	0.0007
Bromobenzene	6.26	0.0016
Carbon bisulfide	2.34	0.0006
Carbon tetrachloride .	5.03	0.0013
Chloroform	3.63	0.0009
Cyclohexane	2.79	0.0007
Ethanol (ethyl alcohol) .	1.22	0.0003
Ethyl acetate	2.77	0.0007
Ethyl ether.	2.02	0.0005
n-Hexane. .	2.75	0.0007
Methanol (methyl alcohol)	0.83	0.0002
Methyl acetate ..	2.15	0.0005
Nitrobenzene	5.24	0.0013
n-Octane .	4.02	0.0010
Phenol .	3.56	0.0009
Toluene .	3.33	0.0008
Water .	0.512	0.0001

MOLECULAR DEPRESSION OF THE FREEZING POINT

Showing the depression of the freezing point due to the addition of one gram molecular weight of dissolved substance, for various solvents.

Solvent	Depression for one gram molecular weight dissolved in 100 gms. °C
Acetic acid .	39.0
Benzene .	49.0
Benzophenone	98.0
Diphenyl	80.0
Diphenylamine	86.0
Ethylene dibromide .	118.0
Formic acid .	27.7
Naphthalene	68-69
Nitrobenzene	70.0
Phenol .	74.0
Stearic acid .	45.0
Triphenyl methane	124.5
Urethane.	51.4
Water.	18.5-18.7

LOWERING OF FREEZING POINT FOR AQUEOUS SOLUTIONS

The concentration of the solutions is expressed as the number of gram formula weights per 1,000 grams of water. The table gives the molal lowering of freezing point in °C for the concentration stated.

CORRECTION OF BOILING POINTS TO STANDARD PRESSURE

BY H. B. HASS AND R. F. NEWTON

This correction may be made by using the equation:

$$\Delta t = \frac{(273.1 + t)(2.8808 - \log p)}{\phi + .15(2.8808 - \log p)} \quad (1)$$

where Δt = degrees C to be added to the observed boiling point.

t = the observed boiling point.

$\log p$ = the logarithm of the observed pressure in millimeters of mercury.

ϕ = the entropy of vaporization at 760 mm.

The value of ϕ may be estimated from the graph and the table. Substances not included in the table may be classified by grouping them with compounds which bear a close physical or structural resemblance to them.

Example 1. Benzene boils at 20°C. at 75 mm pressure. What is its normal boiling point? We do not find benzene in the table but we find hydrocarbons in group 2, and a group 2 compound with a boiling point of 20° has a ϕ of 4.6.

Substituting in the equation:

$$\Delta t = \frac{(273.1 + 20)(2.8808 - 1.8751)}{4.60 + .15(2.8808 - 1.8751)} = 62^\circ$$

Adding this to 20° gives 82° as a first approximation.

The graph shows that the ϕ for a compound of group 2 boiling at 82° is 4.72 instead of 4.60 which we originally used. Since ϕ is in the denominator, this increase will lower our Δt by the ratio, $\frac{4.60}{4.72}$, or the corrected Δt is $62 \times$

$\frac{4.60}{4.72} = 60.4$. Adding Δt to t , gives 80.4° as a second approximation.

The formula can best be used in a slightly different form when the reverse calculation is desired, i.e., when one calculates the vapor pressure at a given temperature, lower than the normal boiling point.

$$2.8808 - \log p = \frac{\phi \Delta t}{273.1 + t - .15 \Delta t} \quad (2)$$

Example 2. Alcohol boils at 78.4°C. What is its vapor pressure at 20°C.? Substituting in equation 2:

$$\begin{aligned} 2.8808 - \log p &= \frac{6.06 \times 58.4}{293.1 - (.15 \times 58.4)} = 1.245 \\ \log p &= 2.8808 - 1.245 = 1.6358 \\ p &= 43.2 \text{ mm.} \end{aligned}$$

Here no second approximation is necessary, since the correct value of ϕ was taken immediately, the normal boiling point having been known.

Water	H ₂ O	0.01089	0.001362

FREEZING MIXTURES

A is the proportion of the substance named in the first column to be added to the proportion of the substance given in column B. The table gives the temperature of the separate ingredients and the temperature attained by the mixture.

(From Smithsonian Tables.)

Substance.	A	B	Initial Temp. ° C.	Temp. ° C. attained by mixt.
$\text{Na}_2\text{C}_2\text{H}_3\text{O}_2$ (cryst.)....	85	H_2O 100	10.7	- 4.7

CHANGE IN VOLUME DUE TO FUSION

The table gives the variation in volume expressed in c.cm. for one gram of the substance.

Substance.	Variation, cm.	Observer.
Aluminum.....	+0.019	Toepler, 1894
Bismuth.....	-0.0034	Toepler, 1894
Cadmium.....	+0.0064	Toepler, 1894
Iron.....	-0.0085	Wrightson, Roberts, 1881
Lead.....	+0.0034	Toepler, 1894
Tin.....	+0.0039	Toepler, 1894
Water.....	-0.083*	Toepler, 1894
Zinc.....	+0.0105	Toepler, 1894

*For one cubic centimeter.

FIXED TEMPERATURE FOR THERMOMETER CALIBRATION

Corrections for pressure are indicated by equations in which p indicates pressure in millimeters of mercury, and t the boiling point at normal pressure.

Points designated by an asterisk (*) are suggested by E. F. Mueller as base points to be used in defining a Standard Working Scale.

Substance	Point	Temperature thermodynamic scale °C	Condition or correction
Hydrogen	Boiling	-252 75	+0.0044 ($p-760$)
Nitrogen.....	Vapor pressure	-195 80	+0.0109 ($p-760$)
Liquid O ₂ *	Vapor pressure	-183 00	+0.0126 ($p-760$) -0.000065 ($p-760$) ²
Isopentane	Freezing	-159 6	
Methylcyclohexane....	Freezing	-126 3	
Ether.....	Rapid freezing or slow melting	-116 3	
Carbon disulfide.....	Freezing	-111 6	
Toluene.....	Freezing	- 95.1

VAPOR PRESSURE OF WATER BELOW 100°C

Pressure of aqueous vapor over water in mm of Hg for temperatures from -15.8 to 100°C. Values for fractional degrees between 50 and 89 were obtained by interpolation.

Temp. °C.	0 0	0 2	0 4	0 6	0 8

VAPOR PRESSURE OF MERCURY

Vapor pressure of mercury in mm. of Hg for temperatures from -38 to 400°C . Note that the values for the first four lines only, are to be multiplied by 10^{-6} .

* Undercooled liquid.

Critical temperature = 31.0°C. Triple point, -56.602 ± 0.005°C; 3885.2 ± 0.4 mm.

VAPOR PRESSURE

Pressure and Density (or Specific Volume) of Saturated Vapor

Pressure of the saturated vapor is given in millimeters of mercury or in atmospheres as indicated; the density of the liquid and saturated vapor in g/cm³, and the specific volume in cm³/g. The temperatures are stated in degrees Centigrade. The normal boiling point is the temperature for which the pressure is 1 atm. or 760 mm. Data refers to the liquid state unless otherwise indicated.

The following abbreviations are used: b.p., boiling point; c.p., critical point; liq., liquid; m.p., melting point; sol., solid; t.p., triple point.

VAPOR PRESSURE

VAPOR PRESSURE

Variation with Temperature

The following table gives the value of the constants a and b in the following equation:

$$\log_{10} p = -\frac{0.05223a}{T} + b$$

where p is the pressure in mm of mercury of the saturated vapor at the absolute temperature T . ($T = t^{\circ}\text{C} + 273.1$).

Elements and Inorganic Compounds

Compound	Formula	Temp range °C	a	b
Aluminum oxide...	Al_2O_3	1840 to 2200 liq.	540,000	14 22
Ammonia	NH_3	-127 to -78 sc..	31,211	9.9974
Ammonium bromide ..	NH_4Br	250 to 400 sol.	90,208	9.9404
Ammonium chloride...	NH_4Cl	100 to 400 sol.	83,486	10.0164
Ammonium cyanide ..	NH_4CN	7 to 17 sol.	41,484	9.978
Ammonium iodide ..	NH_4I	300 to 400 sol.	95,730	10.2700
Ammonium sulphate	NH_4HS	6 to 40 sol.	46,025	10.7500
Antimony ..	Sb	1070 to 1325 liq.	189,000	9.051
Argon.....	A	-208 to -189 sol.	7,814 5	7.5741
Arsenic.....	As	-189 to -183 liq.	6,826 0	6.9605
Arsenous oxide ..	As_2O_3	800 to 860 liq.	47,100	6.692
		440 to 815 sol.	133,000	10.800
		100 to 310 sol.	111,350	12 127
Barium.....	Ba	315 to 490 liq.	52,120	6.513
Bismuth	Bi	930 to 1130 liq.	350,000	15.765
Bismuth trichloride ..	BiCl_3	1210 to 1430 liq.	200,000	8.876
Cadmium	Cd	91 to 213 sol.	13,125	2.681
		150 to 320 9 sol.	109,000	8.664
Cadmium iodide	CdI_2	500 to 840 liq.	99,900	7.897
Caesium	Cs	385 to 450 liq.	122,200	9.269
Caesium chloride ..	CsCl	200 to 350 liq.	73,400	6.949
		986 to 1295 liq	163,200	8 340

LOWERING OF VAPOR PRESSURE BY SALTS IN AQUEOUS SOLUTIONS

The table gives the reduction of the vapor pressure in millimeters due to the presence of the number of grammolecules of salt per liter of water given at the head of the columns, at the temperature 100° C, at which temperature the vapor pressure of pure water is 760 millimeters.

(From Smithsonian Tables.)

HEAT CONDUCTIVITY

Giving the quantity of heat in calories which is transmitted per second through a plate one centimeter thick across an area of one square centimeter when the temperature difference is one degree Centigrade.

THERMAL CONDUCTIVITY OF MATERIALS

(Bureau of Standards Letter Circular No. 227)

D = Density in pounds per cubic foot.

K = Thermal conductivity in B.T.U. per hour, square foot, and temperature gradient of 1 degree Fahrenheit per inch thickness. The lower the conductivity, the greater the insulating values.

SOFT FLEXIBLE MATERIALS IN SHEET FORM

		D	K
Dry Zero	Kapok between burlap or paper..	1.0	0.24
		2.0	0.25

MISCELLANEOUS BUILDING MATERIALS

(Data taken from various sources)

	K		K
Cinder concrete ..	2 to 3	Limestone ..	4 to 9
Building gypsum. .	About 3	Concrete ..	6 to 9
Plaster.	2 to 5	Sandstone ..	8 to 16
Building brick . . .	3 to 6	Marble.	14 to 20
Glass.	5 to 6	Granite.	13 to 28

* From various commercial laboratories and the work of O. R. Sweeney at Iowa State College.

TEMPERATURE OF SATURATED STEAM

The following table gives the temperature of saturated water vapor in degrees Centigrade and degrees Fahrenheit corresponding to gauge pressure in pounds from 0 to 3184. Zero gauge pressure corresponds to an absolute pressure of 14.696 pounds per square inch.

Gauge pressure lbs./in. ²	Temp. °F	Temp. °C	Gauge pressure lbs./in. ²	Temp. °F	Temp. °C	Gauge pressure lbs./in. ²	Temp. °F	Temp. °C

PROPERTIES OF SATURATED STEAM

PROPERTIES OF METRIC AND

The heat units used are the large calorie, 15° to 16° C and the B T U., 62° to 63° F. The heat of the liquid, q , is the heat required to raise unit mass of water from 0° C (32° F) to the temperature indicated. The heat of vaporization, r , is the heat required to vaporize unit mass of water at the indicated temperature and pressure. Total heat involved, $H = r + q$.

The heat of vaporization overcomes external pressure and changes the state from liquid to vapor at constant temperature and pressure. If u is the

SATURATED STEAM

ENGLISH UNITS

change in volume the external work is pu and the corresponding amount of heat is Apu where A is the reciprocal of the mechanical equivalent of heat. The part of the heat of vaporization not used in external work is considered used in changing the state from liquid to vapor. The heat required for this work may be represented by $\rho = r - Apu$.

(From Peabody, Steam and Entropy Tables, John Wiley and Sons, Inc., publishers, by permission.)

HIGH AND LOW TEMPERATURES

Absolute zero, -273.18°C .

M p. of helium	-272°C	Oxy-acetylene flame	3500°C
B.p. of helium	-268.9	Tungsten arc under pressure (Luckey)	4785
M p. of hydrogen	-259.18	Cored carbon arc (Suits)	5500
B.p. of hydrogen	-252.8	Iron welding arc (Suits)	6020
B.p. of liquid air	-192	Tungsten arc, max. (Suits)	6440
Industrial furnaces	1700°C	Exploding wires by high voltage discharge (Anderson)	19700
Bunsen burner	1870	The Sun (Coblentz)	6000°K
Oxy-hydrogen flame	2800	Stars, max. estimated	30000°K
Tungsten tube furnace (Forsythe)	2800		
Carbon arc furnace (Forsythe)	3200		

SCALE OF FUSIBILITY

Number	Mineral	Approximate fusing point	Notes
1	Stibnite	525°C	Fuses easily in a candle flame.
2	Chalcopyrite	800°C	Fuses slowly in a gas flame.
3	Almandite	1050°C	Only finest splinters rounded in a gas flame.
4	Actinolite	1200°C	Standard-size fragments are rounded easily before the blowpipe
5	Orthoclase	1300°C	Standard-size fragments are rounded with difficulty before the blowpipe
6	Bronzite	1400°C	Only finest splinters rounded on points with difficulty before the blowpipe.
7	Quartz	$>1400^{\circ}\text{C}$	Entirely infusible before the blowpipe

CONSTANT TEMPERATURE BATHS

The following substances may be utilized between the temperatures indicated (boiling points) by using pressures from 10 to 76 cm. The second temperature given is the boiling point at the latter pressure. Several of the liquids are inflammable and must be used with caution.

Substance	Temperature $^{\circ}\text{C}$
Ethyl chloride	-31.3 to 12.2
Ethyl ether	-12.1 to 34.5
Carbon disulfide	-4.8 to 46.3
Acetone	7.5 to 56.1
Chloroform	9.7 to 61.2
Methyl alcohol	20.6 to 64.5
Ethyl alcohol	34.4 to 78.5
Benzene	25.8 to 79.8
Water	51.7 to 100
Toluene	51.8 to 110.5
Chlorobenzene	70.3 to 132.1
Isoamyl acetate	142.5
Bromobenzene	90.7 to 156.2
Aniline	119.4 to 184.4
Naphthalene	144.3 to 217.9
Methyl salicylate	$151.$ to 223.3
Isoamyl benzoate	$262.$
Diphenylamine	221 to 302.0
Benzophenone	224 to 305.4
Mercury	261.5 to 356.9
Sulfur	330.7 to 444.6
Zinc	758 to 907

CONVERSION TABLE FOR BAROMETRIC READINGS (Continued)

U. S. Inches to Millibars

Based on the relation 1 inch of mercury at 32°F represents a pressure of 33.8639 millibars.

Note: Figures in last nine columns to be preceded by 7, 8 or 9 as indicated.

CONVERSION TABLE FOR BAROMETRIC READINGS (Continued)

Centimeters to Millibars

Based on the relation 1 centimeter of mercury at 0°C represents a pressure of 13.3322 millibars.

Note: Figures in last nine columns to be preceded by 9.

TEMPERATURE CORRECTION FOR BAROMETER READINGS

BRASS SCALE—METRIC UNITS

To reduce readings of a mercurial barometer with a brass scale to 0°C subtract the appropriate quantity as found in the table. These values are based on the coefficient of expansion of mercury ($181792 + 0.175t + 0.035116t^2$) $\times 10^{-9}$, and of brass 0.0000184 per °C. Corrections are in millimeters.

BRASS SCALE—ENGLISH UNITS

Standard Temperature of scale 62° F; of mercury, 32° F. Zero correction at 28.5° F; subtract corrections above, add below. Owing to the difference in the standard temperature of English and metric scales, readings taken in inches to be reduced to centimeters should *first* be corrected for temperature.

REDUCTION OF BAROMETER TO SEA LEVEL

The correction to be added to reduce barometric readings to "sea level" values depends principally on three factors: The temperature of the air column (assumed) from the station to sea level, the altitude of the station, and the value of the reading itself. Two tables are provided. Table I is entered with the altitude and assumed temperature and a factor "2000 m" taken out. Table II is entered with the above factor and the approximate barometer reading and the final correction taken out.

The correction is to be added. If B_0 is the corrected or sea level value; B the barometer reading at the station; C the correction,—

$$C = B_0 - B = B (10^m - 1)$$

The actual barometer reading at the station should be corrected for temperature of the mercury column by the usual methods before entering the tables or applying the sea level correction.

A complete explanation of the theory of the corrections and a more extended set of tables will be found in the Smithsonian Meteorological Tables.

LATITUDE FACTOR

The influence of the latitude on the value of the correction is usually negligible, being overshadowed by uncertainties in the assumed temperature of the air column. For cases where this correction is desirable the table below is provided. The value of the temperature-altitude factor "2000 m" obtained in Table I is corrected for latitude by subtracting for latitudes 0-45° and adding for latitudes from 45-90° the values found. With this corrected value of "2000 m" Table II is entered for the value of the correction.

LATITUDE FACTOR

To be used in connection with Tables I and II, either English or metric units, to obtain latitude corrections to temperature-altitude factor. For latitudes 0-45° subtract the correction. For latitudes 45-90° add the correction.

Temp.—Alt. from Table I	Latitude			
	0°	15°	30°	45°
100	0 3	0 2	0 1	0 0
200	0 5	0 5	0 3	0 0
300	0 8	0 7	0 4	0 0
	90°	75°	60°	45°

REDUCTION OF BAROMETER TO SEA LEVEL (Continued)

METRIC UNITS—TABLE I

Values of the temperature-altitude factor (2000 m.) for entering table II.

REDUCTION OF BAROMETER TO LATITUDE 45°

METRIC SCALE

For latitudes below 45°, subtract the correction; for latitudes greater than 45° it is to be added. Corrections in cm.
(From Smithsonian Meteorological Tables.)

RELATIVE HUMIDITY FROM WET AND DRY

This table gives the approximate relative humidity directly from the reading of the air pressure of 74.27 cm Hg. Errors resulting from the use of this table for air temperatures

BULB THERMOMETER (CENT. SCALE)

temperature (dry bulb) ($t^{\circ}\text{C}$) and the wet bulb ($t'^{\circ}\text{C}$). It is computed for a barometric above -10°C and between 77.5 and 71 cm Hg will usually be within the errors of observation.

U. S. Weather Bureau No. 1071

REDUCTION OF PSYCHROMETRIC OBSERVATION

For the reduction of observations with the wet and dry bulb thermometer. Assuming the relative velocity of the air to the thermometer bulbs is at least three meters per second; if t is the temperature of the air as indicated by the dry bulb, t_w , the temperature of the wet bulb, B , the barometric pressure, and E_w , the vapor tension of water corresponding to t_w , then the actual vapor tension is

$$E = E_w - 0.00066B(t - t_w)[1 + 0.00115(t - t_w)].$$

The value of the term

$$0.00066B(t - t_w)[1 + 0.00115(t - t_w)]$$

is given in the following table.

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

SOUND ABSORPTION

SOUND ABSORPTION

TABLE I.—GENERAL BUILDING MATERIALS

The following table gives the absorption coefficients of various materials. The reverberation time is usually defined as the time required for the reverberant sound to sink to one milliloudth its initial intensity. This time is given in seconds by the relation, $T_0 = .05 \left(\frac{V}{a} \right)$, where V is the volume of the room in cubic feet and a is the absorption. The absorption a is computed by multiplying the area in square feet of each surface by its absorption coefficient and taking the sum of these products plus the absorbing power of objects, such as seats and furnishings.

Data in the following tables have been selected largely from the Official Bulletin of the Acoustical Materials Association.

Material	Coefficients		
	128	512	2048
Floor Coverings:			
Carpet unlined.....	.09	.20	.27
Carpet felt lined.....	.11	.37	.27

TABLE II.—SPECIAL ACOUSTICAL MATERIALS

The type of material and method of mounting are indicated by symbols as follows:

TYPES OF MATERIALS

1. Cast units composed of small uniform mineral particles held together with Portland cement.
2. Cast units having a surface composed of or resembling small uniform granules. The binder may be gypsum or any other suitable mineral binder.
3. Cast units having a surface composed of or resembling irregular, rough granules. The binder may be gypsum or any other suitable mineral binder.
4. Units having a mechanically perforated surface, which acts as a covering for the sound absorbent material.
5. Units which are mechanically perforated, the perforations extending into the sound absorbent material.
6. Units having a fissured surface.
7. Compressed units composed of long wood fibers held together with a mineral binder. This type shall not have a mechanically perforated surface.
8. Felted fiber or wood pulp units which have a surface that is not mechanically perforated.

TYPES OF MOUNTINGS

1. Cemented to plaster board. Considered equivalent to cementing to plaster or concrete ceiling.
2. Nailed to 1" X 2" wood furring 12" o.c., unless otherwise indicated.
3. Attached to metal supports applied to 1" X 2" wood furring.
4. Laid directly on laboratory floor.
5. Nailed to 1" X 3" wood furring 24" o.c. and filled in between furring with 1" mineral wool, 35 lbs./sq. ft.
6. Laid on 24 ga. sheet iron, nailed to 1" X 2" wood furring 24" c.c.
7. Attached to special metal supports mounted on 2" X 2" wood furring.
8. Nailed to 2" X 2" wood furring 18" or 20" c.c. 2" mineral wool between furring.

* The noise reduction coefficient is the average of the coefficients at frequencies from 256 to 2048 cycles inclusive, given to the nearest 5%. This average coefficient is recommended for use in comparing materials for noise quieting purposes as in offices, hospitals, banks, corridors, etc.

For auditorium treatment, attention should be directed to the coefficients at 512 cycles and other frequencies as explained elsewhere.

† Unless otherwise noted, the thickness given is the thickness of the sound-absorbing element forming the face of the construction. The thickness of other sound-absorbing elements in the construction, if used, is indicated by the type of mounting.

The above compilation is abridged from a complete table published in Volume 73 of the Transactions of the Electrochemical Society, but has been corrected to correspond to the 1942 atomic weights as published by the American Chemical Society and the best values obtainable for the few elements not listed in the official table; in most cases the only valence covered is that which determines the placing of the element in the periodic table, though in a few cases the most important valence from an electrochemical standpoint is given precedence, and for a few of the more important elements two or more valences are given; values for elements in the O group of the periodic system are calculated on the basis of unit valence, listed as *n*, to distinguish them from elements with a true unit valence. For uses where a more complete table is required, the reader is referred to the original publication.

Digits printed in italics may, if desired, be dropped from the values, rounding them off to the nearest preceding digit; such digits have been carried as a matter of convenience and uniformity in calculating and tabulating, but are in excess of the number of significant figures in the primary data, and hence do not add to the true accuracy of the results.

¹ This value varies from the basic figure of 1.1180 mg because of the rounding off of the value of the Faraday to 96,500 coulombs; other values also differ in the same proportion.

² This is the second isotope of hydrogen, and is the only isotope included in the table, as no others have as yet been isolated to a sufficient degree to have their atomic weights determined.

INTERNAL RESISTANCE OF VARIOUS VOLTAIC CELLS

The internal resistance is subject to large variations; the values given can be considered only approximate.

Cell	Resistance, ohms	Cell	Resistance, ohms
Edison-Lalande	0.03	Grove	0.1-0.2
Daniell	0.85	Bunsen	0.1-0.2
Gravity	1-5	Bichromate	0.08-0.40
Silver chloride	4.	Storage	0.004-0.02
Dry cell	0.05-0.10	Clark standard	20-50
Leclanché	0.4-0.2	Weston standard	20-50

IONIZATION POTENTIALS

THE ELEMENTS

The following table gives the ionization potentials in volts for the elements in the atomic state. The degree of ionisation is indicated by the numerals I, II, etc. Doubtful values are indicated by parentheses.

RATIO TABLES FOR BRIDGE CALCULATIONS

The Leeds & Northrup Co.

$$\frac{A}{1000 - A}$$

The first table gives values of the ratio, $A/(1000 - A)$, the value of A being measured from the zero at one end of the scale. If the balance point is at 500, $A = 500$ and the ratio is unity.

RATIO TABLES FOR BRIDGE CALCULATIONS (Continued)

$$\frac{4500 + A}{5500 - A}$$

The second table gives values of the ratio $(4500 + A)/(5500 - A)$, the value of A being measured from the 4500 division on a total scale of 10,000. If the balance point is at 5000, $A = 500$ and the ratio is unity.

CONDUCTIVITY OF STANDARD SOLUTIONS

Giving the conductivity in reciprocal ohms (mho) per cm. for NaCl, KCl, H_2SO_4 and MgSO_4 for various temperatures. Solutions are as follows:—

H_2SO_4 , — maximum conductivity (18°C.); dissolve 378 g. of 97% acid in pure water and dilute to 1 liter. Density at 18°C. , 1.223.

MgSO_4 , — maximum conductivity (18°C.); dissolve in 1 liter of distilled water 552 g. of $\text{MgSO}_4 \cdot 7\text{H}_2\text{O}$. Density at 18°C. , 1.190.

NaCl, — solution saturated at all temperatures given. An excess of NaCl in distilled water, about 450 g. per liter. $D = 1.2014$ (18°C.).

KCl, — normal solution, 74.59 grams per liter of solution at 18°C. . Dissolve 74.555 grams (weighed in air) of KCl and dilute to 1 liter. Density, 1.04492.

RESISTIVITY OF DIELECTRICS

Giving the volume resistivity ρ , the variation of the volume resistivity with temperature, given as the ratio of the value at 20° C. to that at 30° C., and the surface resistivity for various dielectrics. The surface resistivity is the resistance between the opposite edges of a centimeter square. A large part of the data are from Curtis, Bulletin of the Bureau of Standards 1915. Temperatures, unless otherwise stated, are 22° C. The numbers in parentheses refer to the source of information.

RESISTIVITY OF DIELECTRICS (Continued)

DESCRIPTION OF MATERIALS

Amberite is made by compressing scrap amber.

Bakelite. A phenol condensation product, with various fillers. The various samples were made as follows:

Number	Percent pure Bakelite	Filler	Phenolic Body	Condensing Agent
1		Paper	Cresols	Ammonia
140	50	Vegetable	Phenol	Caustic soda
150	50	Fiber	"	Ammonia
190	50	"	Cresols	"
5199	50	"	Phenol	"
5200	50	Fiber & clay	"	"
5074	35	Talc	"	Caustic soda
588	100	None	"	
1 Regular	100	None	Cresols	Ammonia

Ceresin is a waxy material refined from the mineral ozokerite, m.p. below 100° C. sp. gr. 0.91-0.97. Condensite is a phenol condensation product.

Hard fiber, soft cotton paper, treated with zinc chloride, dried and pressed.

Galalith is made from the casein of milk.

Kavalier glass is hard combustion tubing having a large potassium and calcium content.

Glyptal is an artificial resin resembling amber

Gummon, hemit, and tegit are coal tar products

Halowax, chlorinated naphthalenes.

Moulded mica is ground mica and asbestos with shellac.

Stabalite is a rubber compound.

STANDARD CALIBRATION TABLES FOR THERMOCOUPLES

The following tables which represent the Temperature-E. M. F. functions of various thermocouples should be used with appropriate correction curves if precise results are desired. These curves must be determined for each individual couple by plotting ΔE , the difference between the observed and the standard E. M. F., against the standard E. M. F. at three or more fixed temperature points. The value ΔE as shown by such a correction curve is then subtracted algebraically from the observed E. M. F. to give the true E. M. F. reading.

In the following tables the fixed or "cold junction" is at 0° C.; when the cold junction is not maintained at 0° C. the readings of the E. M. F. must be corrected as follows: $E_t = E_{(t-t_c)} + E_{tc}$ where $E_{(t-t_c)}$ is the observed reading, E_{tc} is the E. M. F. for the temperature corresponding to the cold junction temperature as read from the standard table and E_t is the E. M. F. produced by the hot junction corrected to the value which would be obtained with the cold junction at 0° C. The temperature corresponding to E_t is then obtained by reference to the standard table.

Since the E. M. F.-temperature function is not linear the cold junction should be maintained at a temperature very close to that at which the thermocouple was calibrated. Otherwise considerable error will result despite the above correction.

TEMPERATURE-E. M. F. VALUES FOR PLATINUM- PLATINUM (90%), RHODIUM (10%) THERMO- ELEMENTS

E. M. F. values are in millivolts; temperatures are in degrees Centigrade
(Computed from values in the International Critical Tables)

THERMOELECTRIC POWER

The table gives the thermoelectric power in microvolts per degree Centigrade difference in temperature when the cold junction is at 0°C.

The values given are with respect to lead except where noted. A is the thermoelectric power at 0°C, B is the coefficient of t in the equation for the thermoelectric power at any temperature t ,—

$$Q = A + Bt.$$

The values are regarded as positive if the current flows from the metal listed to the reference metal (usually lead) at the cold junction.

MAGNETIC CONSTANTS OF IRON

Permeability of Transformer Iron

Giving M , the total magneto motive force applied. M/l , the magnetic motive force per unit length of iron circuit. B the total induction, B/a the induction per unit cross-section of iron, M/B , the magnetic reluctance of the iron circuit and Bl/Ma , the permeability; showing the typical relations of the magnetic constants for varying field.

(From Smithsonian Tables.)

M .	M/l .	B .	B/a .	Reluctance $M/B = K$.	Permea- bility Bl/Ma $= \mu$.

MAGNETIC SUSCEPTIBILITY

The following tables give the specific susceptibility χ for various substances. The relation to volume susceptibility κ is shown by the equation $\chi = \kappa/d$, where d is the density of the substance. Unit of χ , 1×10^{-6} cgs electromagnetic units. Room temperature is to be understood where no other is stated. The values are positive for paramagnetic bodies, negative for diamagnetic.

ELEMENTS AND INORGANIC COMPOUNDS

Substance	Formula	Temp. °C	Suscepti- bility 10^{-6} cgs	Ob- server

MAGNETIC INCLINATION OR DIP AND HORIZONTAL INTENSITY

The mean or limiting values are given for the territory covered by the State named. The horizontal intensity is given in gausses. The table is compiled from the results of the U. S. Coast and Geodetic Survey for 1911 and 1912.

State.	Dip, degrees.		Horizontal intensity.	
Alabama.....	62.	to 66.	.23 to	.26
Alaska.....	67.	74.	.16	.21
Arizona.....	59.		.27	
Arkansas.....	63.	65.	.24	.25
California.....	58.	62.	.25	.27
Colorado.....	67.	68.	.22	.23
Connecticut.....	72.	73.	.17	.18
Delaware.....	70.	71.5	.19	.20
Florida.....	57.	58.	.27	.29
Georgia.....	62.	66.	.23	.26
Hawaii.....	39.		.29	
Idaho.....	69.		.21	
Indiana.....	69.	72.	.18	.21
Iowa.....	71.	73.	.18	.20
Kansas.....	67.	69.	.21	.23
Kentucky.....	68.	70.	.20	.22
Maine.....	74.	76.	.14	.16
Maryland.....	70.		.20	
Massachusetts.....	73.		.17	
Michigan.....	73.	76.	.15	.18
Mississippi.....	61.	66.	.24	.26

MASS ABSORPTION COEFFICIENTS FOR X AND γ RAYS

Radiation traversing a layer of substance is reduced in intensity by a constant fraction μ per centimeter. After penetrating to a depth x the intensity is $I = I_0 e^{-\mu x}$ where I_0 is the intensity at the surface. μ/ρ is the mass absorption coefficient where ρ is the density of the material.

Values of μ/ρ for $\lambda = .005 \text{ \AA}$ to $\lambda = 44.6 \text{ \AA}$. Where two values of μ/ρ for one value of λ occur they represent the maximum and minimum values at an absorption discontinuity.

Compiled by S. J. M. Allen

$\lambda = 44.6 - 2.74 \text{ \AA}$

X-RAY CRYSTALLOGRAPHIC DATA*

Compiled with the collaboration of John G. Albright

The following table presents crystallographic data for about 1300 compounds. For convenience they have been separated into; elements, inorganic compounds, minerals, metal-organic compounds and organic compounds. Alloys will be found among the inorganic compounds under one or the other of the metal constituents.

The crystal system is given using abbreviations indicated below. The type of structure is indicated by reference to certain characteristic compounds. The space group is indicated by the symbols of the Schoenflies system. The dimensions of the unit cell *a*, *b*, and *c* in angstrom units are given in order followed in some cases by axial angles. The last column indicates the number of molecules per unit cell.

For an explanation of the space group symbols, structure types or other details of crystallographic data see Wyckoff: *The Structure of Crystals* and also Davy: *Study of Crystal Structure and its Applications* (p. 672).

Abbreviations: b.c., body centered; c.p. close packed; cub., cubic; dia., diamond; f.c., face centered; hex., hexagonal; monoc., monoclinic; rhbdr., rhombohedral; rhomb., rhombic; tetr., tetragonal; tricl., triclinic.

THE ELEMENTS

LIGHT

PHOTOMETRIC QUANTITIES, UNITS AND STANDARDS

Photometric quantities and units are also given in the section Quantities and Units under the sub-division Light.

Candle (or International Candle). The candle is the unit of luminous intensity. It is a specified fraction of the average horizontal candlepower of a group of 45 carbon-filament lamps preserved at the Bureau of Standards.

Lumen. The lumen is the unit of luminous flux. It is equal to the flux through a unit solid angle (steradian) from a uniform point source of one candle, or to the flux on a unit surface all points of which are at unit distance from a uniform point source of one candle.

Illumination. Illumination is the density of the luminous flux on a surface. It is the quotient of the flux by the area of the surface when the latter is uniformly illuminated.

Least Mechanical Equivalent of Light. One lumen at the wavelength of maximum visibility (0.556μ) equals 0.00161 watts ($= 0.000385$ gram calories per sec.); one watt at the same wavelength equals 621 lumens.

Relative Visibility. The relative visibility factor for a particular wavelength is the ratio of the visibility factor for that wavelength to the maximum visibility factor.

Values of the relative visibility are given as a part of the specification of the standard observer under Colorimetry.

Efficiency of a Source of Light. The efficiency of a source is the ratio of the total luminous flux to the total power consumed. In the case of an electric lamp it is expressed in lumens per watt.

Spherical Candlepower. The spherical candlepower of a lamp is the average candlepower of the lamp in all directions in space. It is equal to the total luminous flux of the lamp in lumens divided by 4π .

FLAME STANDARDS

VALUE OF VARIOUS FORMER STANDARDS IN INTERNATIONAL CANDLES

Standard Pentane Lamp, burning pentane . . .	10 0 candles
Standard Hefner Lamp, burning amyl acetate . . .	0 9 "
Standard Carcel Lamp, burning colza oil . . .	9 6 "

The *Carcel unit* is the horizontal intensity of the carcel lamp, burning 42 grams of colza oil per hour. For a consumption between 38 and 46 grams per hour the intensity may be considered proportional to the consumption.

The *Hefner unit* is the horizontal intensity of the Hefner lamp burning amyl acetate, with a flame 4 cm. high. If the flame is l mm. high, the intensity $I = 1 + 0.027(l - 40)$.

EFFICIENCIES OF ILLUMINANTS

The rating listed is the commercial rating of the lamp. The absolute efficiency is the equivalent power in light flux (at 0.556μ) per watt input. Efficiency is given in lumens per watt input.

Lamp	Rating, or Specifications	Eff.	Ab. Eff.
Acetylene . . .	1 0 liters per hour	.67	0.0011
Arc, Electric			
Carbor, Enclosed, d.c..	6.6 amp., opal globe and reflector	5.9	0.0095

FLAME SPECTRA

Compiled by T. G. Kennard

Listed below are the prominent lines and bands given by volatile compounds when introduced into a gas flame. Additional, weaker lines are often observed. Wave lengths are stated in Ångströms, and in the case of bands refer to the position of the band head. Bands are designated by the symbol (b); the most sensitive or persistent lines or bands are designated by P.

WAVE LENGTH OF THE PRINCIPAL LINES IN THE EMISSION SPECTRA OF THE ELEMENTS*

The following table gives the wave lengths of the principal lines of the emission spectra of elementary substances, produced by the arc, spark or Geissler tube.

Wave Lengths are stated in ångströms and refer to air at a pressure of 1 atmosphere except in the Schumann region. 1 ångström (Å) = 10^{-8} cm = 10^{-4} microns (μ) = 10^{-1} millimicrons (m μ) = 100 $\mu\mu$.

Intensities of lines are indicated by the numbers 1 to 10, the latter, the higher intensity. For more complete tables the reader is referred to Kayser: *Handbuch der Spektroskopie*.

Characteristics of the lines are indicated by symbols following the intensity numbers, as shown below.

The **number of components** of an unresolved line is indicated by the subscripts: 2, 3, 4 attached to the intensity number.

Classes of spectra are indicated by the symbols I, II, III etc. referring to lines emitted by the neutral, ionized or doubly ionized atom. These symbols precede the wave length.

Persistent lines are indicated by p. The most sensitive of the persistent lines by P. These symbols follow the wave length.

r, easily reversed

n, broad or nebulous

N, very broad and diffuse

<, broadened toward greater wave lengths

>, broadened toward shorter wave lengths

2, 3, 4, etc., unresolved line of 2, 3 or 4 components

I, II, III etc., classes of spectra emitted by the neutral, ionized or doubly ionized atom respectively

p, persistent lines

P, the most sensitive of the persistent lines.

* See also supplementary tables following this collection.

SUPPLEMENTARY TABLES OF SPECTRA

The following collection of spectra includes tables recently published, many of which are especially important in quantitative spectrum analysis. Values of certain wave lengths which occur in the main table, just preceding, will not always agree exactly with those given here. The authority for the latter will, however, be quoted in each case.

Intensities are in most cases given on King's scale (H. N. Russell, Proc. Nat. Acad. Sci. 11, 322, 1925)

Abbreviations

<i>a</i> = absorption	<i>p</i> -- for list of lines of Tungsten.
<i>b</i> = widened, not sharp	apparent pole-effect or trans-
<i>B</i> = band head	verse variation of intensity
<i>c</i> = complex, hyperfine structure	<i>pr</i> = reversed only at end of line
<i>cm</i> = complex, hyperfine structure	<i>I'</i> = most sensitive of persistent
measured	line, "rai ultimate"
<i>d</i> = double	<i>r</i> = narrow, self-reversed
<i>e</i> = enhanced at electrode	<i>R</i> = wide, self-reversed
<i>E</i> = enhanced in spark spectrum	<i>r</i> = violet, shaded or displaced to
<i>h</i> = hazy	shorter wave lengths
<i>H</i> = very hazy	<i>w</i> = wide, hyperfine structure
<i>l</i> = shaded or displaced to longer	<i>W</i> = very wide, hyperfine structure
wave lengths	<i>I</i> = spectrum of neutral atoms
<i>M</i> = molecular spectrum Ia O band	<i>II</i> = spectrum of singly ionized
head	atoms
<i>n</i> = head of band due to oxide	<i>III</i> = spectrum of doubly ionized
<i>p</i> = part of band structure	atoms

Argon, Infrared Spectrum

Abridged from the list of Meggers and Humphreys, Jour. Research of B of N 10, 427, 1933. The original list contains 200 lines. All lines of an intensity of 8 or above are included in the following table. The source was an "end on" Geissler tube

Helium, Infrared Spectrum

From the list of Meggers and Dieke, Jour. Research of B. of S. **9**, 121, 1932. The original list contains 120 lines. All lines of an intensity of 8 or above are given in the following table. The source was an "end on" Geissler tube.

$\lambda_{\text{air A}}$	Inten- sity	$\lambda_{\text{air A}}$	Inten- sity	$\lambda_{\text{air A}}$	Inten- sity	$\lambda_{\text{air A}}$	Inten- sity
9124.29	8	9142.23	12	9257.50	20	9341.91	15
9130.66	10	9222.96	10	9297.14	20	9391.90	10

SUPPLEMENTARY TABLES OF SPECTRA (Continued)

SUPPLEMENTARY TABLES OF SPECTRA (Continued)

Vanadium, Arc Spectrum, V_I

Meggers and Russell, Jour. Research of B. of S. 17, 125, 1936.

The following table is abridged from the list as published by Meggers and Russell which contains 2525 lines. All lines of an intensity of 8 or above are given.

Wave lengths are given on the International Scale, intensities according to King's scale.

λ_{air} A	Arc	λ_{air} A	Arc	λ_{air} A	Arc

Iron, Wave Lengths in the Ultraviolet Spectrum

The following table presents the results of interferometer measurements made by Meggers and Humphreys and reported in the Jour. Research of B. of S. 18, 543, 1937. The standard iron arc was used as a source and the wave lengths in air at 15°C. and 76 mm are given in international Ångströms.

Iron, Wave Lengths in the Infrared

From interferometer measurements by Meggers, Jour. Research of B. of S. 14, 33, 1935. The integrated light from the iron arc was used as a source. Wave lengths in air at 15°C and 760 mm are given as well as the intensity.

Neon

From Meggers and Humphreys, Jour. Research of B. of S. **13**, 293, 1934. The source was an "end on" Geissler tube. Values are given for the wave length in air at 15°C and 760 mm pressure, and referred to the primary standard (Cd 6438.4696 Å) and also to the red lines of neon. For complex lines the value for the principal component is given.

STANDARD WAVE LENGTHS (Continued)

Neon_I, Ultraviolet Lines

From Humphreys, Jour. Research of B. of S. **20**, 17, 1938. The source was an "end on" Geissler tube. Values are given for the wave length in dry air at 15°C and 760 mm of Hg pressure and referred to the Krypton secondary standards.

PERSISTENT LINES OF THE ELEMENTS

Spectra of the neutral atom, the singly ionized atom, and the doubly ionized atom are indicated by I, II, and III, respectively. The most sensitive lines are indicated by an asterisk (*). The symbol "D" preceding the intensity indicates the discharge-tube spectrum. Wave lengths are given in International Angstrom units.

Wave lengths and intensities of lines between 2000 and 9999 Angstroms have been given according to the M.I.T. Wavelength Tables.

INDEX OF REFRACTION

Indices of refraction for elements, inorganic, metal-organic and organic compounds and minerals will be found in the tables of physical constants for the various classes of substances in the section Properties and Physical Constants.

Values for compounds not there listed and data subsequently collected are given below.

Indices not otherwise indicated are for sodium light, $\lambda = 589.3 \text{ m}\mu$. Other wave lengths are indicated by the value in millimicrons or symbol in parentheses which follows the index. Wave lengths are indicated as follows: He, $\lambda = 587.6 \text{ m}\mu$; Li, $\lambda = 670.8 \text{ m}\mu$; Hg, $\lambda = 579.1 \text{ m}\mu$; A, $\lambda = 759.4 \text{ m}\mu$; C, $\lambda = 656.3 \text{ m}\mu$; D, $\lambda = 589.3 \text{ m}\mu$; F, $\lambda = 486.1 \text{ m}\mu$.

Temperatures are understood to be 20°C for liquids, or ordinary room temperatures in the case of solids. Other temperatures appear as superior figures with the index.

Indices for the elements and inorganic compounds will be understood to be for the solid form except as indicated by the abbreviation liq.

ELEMENTS

See also under Physical Constants of Inorganic Compounds and Index of Refraction of Gases.

Name	Formula	Index
Bromine (liq.)	Br_2	1.661 ¹⁶
Cadmium (liq.)	Cd	0.82 (579 $\text{m}\mu$)
(sol)		1.13
Chlorine (liq.)	Cl_2	1.385
(gas)		1.000768
Hydrogen (liq.)	H_2	1.0974 ⁻⁵⁶² 83 (579 $\text{m}\mu$)
Iodine (sol)	I_2	3.34
(gas)...		1.001920
Lead	Pb	2.6 (579 $\text{m}\mu$)
Mercury (liq.)	Hg	1.6-1.9
Nitrogen (liq.)	N_2	1.2053 ⁻¹⁹⁰
Oxygen (liq.)	O_2	1.221 ⁻¹⁸¹
Phosphorus (yel) (sol)		2.1442 ²⁸
Selenium	Se_8	3.00, 4.04
(amor.) (sol)		2.92
Sodium (liq.)	Na	0.0045
(sol)		4.22
Sulfur (liq.)	S_8	1.929 ¹¹⁰
(amor.) (sol.)		1.908
(rhombic, α)		1.957, 2.0377, 2.2454
Tin (liq.)	Sn	2.1

INORGANIC COMPOUNDS

Uranyl potassium sulfate	$\text{UO}_2 \cdot \text{SO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 2\text{H}_2\text{O}$	1.5144, 1.5256, 1.5705 (580 $m\mu$)
Vanadium ammonium sulfate	$\text{VNH}_4(\text{SO}_4)_2 \cdot 12\text{H}_2\text{O}$	1.475
Zinc ammonium selenate	$\text{Zn}(\text{SeO}_4)(\text{NH}_4)_2\text{SeO}_4 \cdot 6\text{H}_2\text{O}$	1.5240, 1.5300, 1.5385
bromate	$\text{Zn}(\text{BrO}_3)_2 \cdot 6\text{H}_2\text{O}$	1.5452
cesium sulfate	$\text{ZnCS}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	1.5022, 1.5048, 1.5093
chloride	ZnCl_2	1.687, 1.713
fluosulfate	$\text{ZnSiF}_6 \cdot 6\text{H}_2\text{O}$	1.3824, 1.3956
potassium cyanide	$\text{ZnK}_2(\text{CN})_4$	1.4115
" selenate	$\text{ZnK}_2(\text{SeO}_4)_2 \cdot 6\text{H}_2\text{O}$	1.5121, 1.5181, 1.5335
" sulfate	$\text{ZnK}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	1.4775, 1.4833, 1.4969
rubidium sulfate	$\text{ZnRb}_2(\text{SO}_4)_2 \cdot 6\text{H}_2\text{O}$	1.4833, 1.4884, 1.4975
sulfate	ZnSiO_3	1.616, $1.62 \pm$, 1.623
Zirconium ammonium fluoride	$\text{Zr}(\text{NH}_4)_3\text{F}_7$	1.433

ORGANIC COMPOUNDS
See also under Physical Constants of Organic Compounds.

Name	Index
Allontoin, solid	α 1.579, γ 1.660
Dimethyl thiophene (α, α'), liq	1.51693 ¹³ (He)
" " (β, β'), liq	1.52217 ¹⁵ (He)
Ethyl carbylamine, liq	1.3659 ²⁴
Ethylidene cyanhydrin, liq	1.40582 ¹⁸ 4
Hexyl acetylene (n), liq	1.4208 ¹² 6

MISCELLANEOUS

Albite glass	1.4890	Magdala red	1.90
Amber	1.546	Obsidian	1.482-1.496
Anorthite glass	1.5755	Paraffin	1.43295 ^{38,3} (C)
Asphalt	1.635	Quartz, fused	1.45640 (656 $m\mu$)
Bell metal	1.0052		1.45843 (589 $m\mu$)
Borax, amorphous, fused	1.4630		1.46190 (509 $m\mu$)
Canada balsam	1.530		1.47503 (361 $m\mu$)
Ebonite	1.66 (red)		1.49634 (275 $m\mu$)
Fuchsin	2.70		1.53386 (214 $m\mu$)
Gelatin, Nelson's No. 1	1.530		1.57464 (185 $m\mu$)
Gelatin, various	1.516-1.534	Resin, aloes	1.619 (red)
Gum Arabic	1.480 (1.514) (red)	colophony	1.548 (red)
		copal	1.528 (red)
Hoffman's violet	2.20	mastic	1.535 (red)
Ivory.	1.539, 1.541	Peru balsam	1.593

MOLECULAR REFRACTION

The molecular refraction of a substance may be computed by the following relation,—

$$N = \frac{M(n^2 - 1)}{d(n^2 + 2)}$$

where N is the molecular refraction for a specified wave length and temperature, M , the molecular weight, d , the density and n the refractive index for the specified conditions.

LIQUIDS FOR INDEX BY IMMERSION METHOD

Liquid	N_D 24° C
Trimethylene chloride	1 446
Cineole	1 456
Hexahydrophenol	1 466
Decahydronaphthalene	1 477
Isoamylphthalate	1 486
Tetrachloroethane	1 492
Pentachloroethane	1 501
Trimethylene bromide	1 513
Chlorobenzene	1 523
Ethylene bromide + Chlorobenzene	1 533
α -Nitrotoluene	1 544
Nylidine	1 557
α -Toluidine	1 570
Aniline	1 584
Bromoform	1 595
Iodobenzene + bromobenzene	1 603
Iodobenzene + Bromobenzene	1 613
Quinoline	1 622
α -Chloronaphthalene	1 633
α -Bromonaphthalene + α -Chloronaphthalene	1 640-1 650
α -Bromonaphthalene + α -Iodonaphthalene	1 660-1 690
Methylene iodide + Iodobenzene	1 700-1 730
Methylene iodide	1 738
Methylene iodide saturated with sulfur	1 78
Yellow phosphorus, sulfur and methylene iodide (8.1 by weight)	2 06
Can be diluted with methylene iodide to cover range 1.74-2.06. For precautions in use, cf. West, Am Mineral, 21, p. 245-9 (1936).	

HEAVY LIQUIDS FOR MINERAL SEPARATION

Liquid	Density
Tetrabromethane (sym.)	2 964, 20° 4°
Can be diluted with carbon tetrachloride (1.595) or benzene (0.894).	
Methylene iodide	3 325, 20° 4°
Can be diluted with carbon tetrachloride or benzene.	
Thallium formate, aq	3 5
Can be diluted with water	
Thallium malonate-thallium formate, aq	4 9
Can be diluted with water.	

For preparation and recovery of these liquids, cf. U. S. Bureau Mines, Rept. Inv. #2897 (1928).

INDEX OF REFRACTION OF WATER

Alcohol and Carbon Bisulfide

For sodium light, $\lambda = .5893$

OPTICAL CONSTANTS OF METALS

The following table gives the refractive index n , the absorption index k , the angle of principle incidence ϕ , the angle of principle azimuth ψ and the percent of light reflected R .

The reduction of amplitude of the wave of the wave length λ after traveling any distance d in the medium is given by the ratio $1 : e^{\frac{2\pi dk}{\lambda}}$. $\bar{\phi}$ is the angle of incidence for which the phase change between the two rectangular components vibrating in and normal to the plane of incidence is 90° . $\bar{\psi}$ is the azimuth at which circularly polarized light results. These quantities are connected by the following relations

$$k = \tan 2\bar{\psi}(1 - \cot^2 \bar{\phi}), \quad n = \frac{\sin \bar{\phi} \tan \bar{\phi}}{(1+k^2)^{\frac{1}{2}}} (1 + \frac{1}{2} \cot^2 \bar{\phi})$$

DISPERSION

The dispersion for various types of optical glass is shown in the following table. n_D = index of refraction for the D line (of the solar spectrum) and n_F and n_C the index for the F and C lines respectively ($n_F - n_C$) shows the dispersion for these two wave lengths.

Glass.	n_D	$(n_F - n_C)$
Light phosphate crown.....	1.5159	.00737

COEFFICIENT OF TRANSPARENCY OF UVIOI GLASS FOR THE ULTRA-VIOLET

For a thickness of 1 mm.

Wave length, microns.....	0.280	0.309	0.325	0.346	0.361	0.383	0.397
Uviol crown.....	0.56	0.95	0.990	0.996	0.999	1.000	1.000

REFLECTION OF LIGHT BY GLASS IN AIR

The table gives the percentage R of light reflected by one surface of glass having a refractive index of 1.55 relative to air. The angle of incidence is i , and the angle of refraction is r . The two components of the polarized light are marked \parallel and \perp according to the electric vector of the vibration. (Computed according to Fresnel's formula.)

i	r	\parallel	\perp	R
0	0° 0'	4 65	4 65	4 65
10	6° 26'	4 84	4 47	4 66
20	12° 45'	5 45	3 92	4 68
30	18° 49'	6 64	3 00	4 82
40	24° 30'	8 77	1 75	5 26

TEMPERATURE CORRECTIONS

Below 20°C the correction should be subtracted from the per cent sugar.
Above 20°C the correction is to be added to the per cent sugar.

Spectral Emissivity of Oxides

The emissivity of oxides and oxidized metals depends to a large extent upon the roughness of the surface. In general, higher values of emissivity are obtained on the rougher surfaces

Material	Range of observed values	Probable value for oxide formed on smooth metal	Material	Range of observed values	Probable value for oxide formed on smooth metal
Aluminum oxide	0 22-0 40	0 30	Alumel (oxidized)	..	0 87

PIGMENTS AND DYES

PIGMENTS AND DYES

The tables which follow give the fraction of incident light reflected by pigments or transmitted by dyes. The pigments were in dry powdered form and the dye solutions, except where indicated, in distilled water. Wave lengths are given in microns.

(Luckiesch, 1917)

TRANSMISSION OF COLORED GLASSES

If I_0 is the intensity of radiation entering a layer of some medium and I the intensity reaching the opposite surface, the ratio I/I_0 is called the transmittance. In practice the ratio of intensity of radiation passing through a glass sample to that incident on its surface is often measured and plotted as transmission. The transmission is the result of two factors, the transmittance of the glass and the losses by reflection. These losses amount to about 4% for each glass-air surface; the transmission of a sample is about 92% of its transmittance. Since the reflection losses differ slightly with different samples, the correction is often determined and applied when the transmission is measured. Values which are thus corrected are marked * at the head of the column.

In order to obtain the transmittance for thicknesses other than those listed it is convenient to transform the tabular values to terms of βt in the equation $I/I_0 = e^{\beta t}$ where t is the thickness (in millimeters) and β a constant for a particular sample. The base 10 is conveniently used in place of e so that βt becomes the common logarithm of the transmittance, or $\beta t = \log I/I_0$. Using the corrected value of the transmittance for a specific thickness, found in the table, the value of βt may be found, changed to the value for the new thickness and the transmittance for the second thickness computed.

For example: The tabular value of transmission for sample CG 396 at $\lambda = .46\mu$ is given as 0.80 for a thickness of 2 mm. It is desired to find the transmittance for 5 mm.

The corrected value of the transmittance for 2 mm is 0.80/.92 or about 0.871. $\log 871 = 9.94002-10$. Writing this as a wholly negative number the equation becomes $\beta t = -.05998$. For $t = 5$ $\beta t = -.05998 \times 5/2 = -.14995$ or changing to the more familiar form gives 9.85005-10 which is the logarithm of the new transmittance which is found to be .708. The transmission will be .92 \times .708 or .651.

In order to identify the glasses listed, the manufacturer's number is given preceded by an abbreviation of the maker's name, as follows: **AO**, American Optical Co.; **BL**, Bausch & Lomb Optical Co.; **CE**, Chicago Eye Shield Co.; **CG**, Corning Glass Works. Data for Jena glasses are given separately in section II of the table.

This table has been compiled with the assistance of: Mr. H. P. Gage, Corning Glass Works; Mr. J. Liautaud, Chicago Eye Shield Co.; Mr. W. B. Rayton, Bausch & Lomb Optical Co.; Mr. A. J. Weinstein of the Fish-Shurman Corporation

TRANSMISSION OF WRATTEN FILTERS

Data condensed from Wratten Light Filters, published by Eastman Kodak Co., manufacturers of the filters.

The following pages give the percent transmission for the dyed gelatin only, unless otherwise indicated. Values for the transmission for wave lengths less than 0.40μ and greater than 0.70μ are computed from density curves while the values for the visible spectrum are taken directly from transmission tables. The values thus computed for the transmission in the ultraviolet and infrared are necessarily less accurate and are intended only as a general guide to the characteristics of the filters. These values are printed in italics.

In case the gelatin filters are cemented between sheets of glass the transmission at any wave length will be the product of the filter transmission and the transmission of glass for that wave length. See No. 00.

To save space the name, use and stability of the filters are indicated in the list below. The following abbreviations are used:

abs., absorbs	neut., neutral	sl., slightly
compl., complementary	ortho., orthochromatic	trans., transmits
exp., experimental	phot., photography	uns., unstable
ir., infrared	s., stable	uv., ultraviolet
m.s., moderately stable	sens., sensitive	v.s., very stable

No.	Name, use and stability	No.	Name, use and stability
	Colorless	23	E red, contrast, m.s.
00	Two pieces of "B" glass cemented together, such as ordinarily used for mounting gelatin filters.	23A	E red (light), exp. tricolor projection, m.s.
0	Plain gelatin, focusing, s	23B	Two-color red, additive projection, m.s.
1	β -Naphtholdisulfonic acid, abs. uv., m.s.	24	Projection red, additive tricolor projection, m.s.
2	Aesculine, abs. uv, uns. (turns brown).	24A	Projection red (light), projection, m.s.
2A	—, abs. uv., s.	25	A (tricolor red), contrast, m.s.
	Yellow	26	Stereo red, for anaglyphs, m.s.
3	Aero No. 1, aerial phot, v.s.	27	Stage red, exp. tricolor, s.
3N5	—, ortho., Aero No 1 with neut. density, v.s	27A	Stage red (light), exp. tricolor, s.
4	Kodak color filter, ortho, v.s	28	Ciné red, two-color taking, s.
5	Aero No. 2, aerial phot, v.s.	29	F, contrast, m.s. (darkens sl.).
5N5	—, ortho., Aero No. 2 with neut. density, v.s.		Magenta and Violet
6	K1, ortho., v.s		Transmitting both red and blue
7	K1 $\frac{1}{2}$, ortho., v.s.	30	Rose bengal, absorption, uns.
8	K2, ortho., v.s.	30A	Q, absorption, m.s.
9	K3, ortho., v.s.	31	Minus green 1, absorption, sl. uns.
11	X1, ortho, v.s.	32	Minus green 3, compl., m.s.
12	Minus blue, compl., v.s.	33	Xylene red, absorption, s.
13	X2, ortho., v.s.	34	D (light), absorption, sl. uns.
15	G, contrast, v.s.	35	D, contrast, m.s.
16	Flavazine T, contrast, v.s.	36	Methyl violet B.B.R., absorption, m.s.
17	Quinoline yellow, trans. uv, abs. violet, s.		Blue and Blue Green
18A	Ultraviolet, trans uv and ir. only, s. Glass filter	38	Toluidine blue, absorption, v.s.
	Orange and Red	38A	Dark toluidine blue, absorption, v.s.
21	Monobromofluoresceine, contrast, m.s.	39	Duplicating, contrast, s. Glass filter
22	E2, contrast, m.s.

TRANSMISSIBILITY FOR RADIATIONS

Ratio of the transmitted light to the incident light for a definite thickness of the substance, usually 1 cm.

GLASS.

Glass in general is opaque to the ultra-violet and infra-red. Uviol glass is transparent to the longer radiations of the ultra-violet.

Coefficient of transparency of glass for visible and ultra-violet radiations.

Wave length microns.....	Normal incidence, thickness 1 cm.								
	0.309	0.330	0.347	0.357	0.361	0.375	0.384	0.388	0.396

QUARTZ

Quartz is very transparent to the ultra-violet and to the visible spectrum, but opaque for the infra-red beyond 7.0 μ .

(Pfüger.)

Wave length, microns.....	0.19	0.20	0.21	0.22
Transmission for 1 mm.....	.67	.84	.92	.94

FLUORITE

Fluorite is very transparent to the ultra-violet, nearly to 0.10 μ . Coefficient of transparency at $\lambda=186$ is found by Pfüger to be 0.80.

For the infra-red the values are given in a table below.

TRANSMISSIBILITY FOR RADIATIONS (Continued)

FLUORESCENCE

GASES AND VAPORS.

Gas or vapor.	Condition.	Excitation.	Color or wave length of emitted light.	Observer.
Iodine..	Vapor at ordinary temperature.	Mercury arc $\lambda = .546\mu$	Strongest bands $\lambda = .5460\mu, .5774\mu, .5730, .5796$	Wood, 1911
Mercury.	Vapor at ordinary temperature	Spark between aluminum electrodes	Broad band $\lambda = .5900-.3000$	Wood, 1909
Oxygen.	Mercury arc in quartz tube	Strongest lines $\lambda = .1849, .1851$ (ultra-violet)	Streubing, 1910
Potassium	Vapor, 300°-400° C.	White light	Many strong lines from .6416-.6768, strongest .6544 and .6584	Wood & Carter, 1908
Rubidium	Vapor, at 270° C.	White light (elec. arc)	Strong red band $\lambda = .6900-.6620$	Dunoyer, 1912
Sodium..	Vapor at 350° C.	White light (elec. arc)	D, $\lambda = .5893$ (mean)	Dunoyer, 1912

FLUORESCENT SUBSTANCES

By Jack De Ment

The emission of light from matter under the influence of an exciting agent is termed fluorescence. When emission persists after removal of the exciting agent the process is termed phosphorescence. Both are practically identical, except in the duration of light emission, and may harmoniously be explained on the same basis. Luminescence is the term covering both phenomena, although candoluminescence, emission due to incandescent heat, may also be included. Fluorescence is classified according to the exciting agent(s) and special terms are derived therefrom.

Excitation includes over 30 processes by which energy is introduced into, and/or released from, the luminescent system; visible light (photoluminescence); low temperature heat (thermoluminescence); friction (triboluminescence); cold (baroluminescence); ion streams (ionoluminescence); cathode rays (cathodoluminescence); crystallization (crystalloluminescence); sound waves (sonoluminescence); Hertzian waves; radioelement radiations, e.g., alpha, beta (positrons), and gamma rays (radio-luminescence, etc.); neutrons; metabolic processes (bioluminescence); and a large number and wide variety of chemical reactions (chemiluminescence); etc. Terms such as radiophotoluminescence and tribothermoluminescence denote the exciting action of more than one agent.

Ultraviolet light is used with most success in ordinary studies on luminescent substances. Most effectively suited for general excitation of inorganic chemicals, phosphors, certain minerals, etc., whose exact absorption characteristics are unknown, is short wavelength ultraviolet light (Hg = 2537A, resonance radiation) filtered through a medium (usually glass) possessing peak transmission in this region and minimal transmission elsewhere, especially in the visible. For general excitation of organic and metal-organic compounds, and a few minerals, as well as tissues, long wavelength (Hg = 3650A) radiation is employed. All ultraviolet light must be filtered before adequate results are obtained.

Slight discordance is noted in the fluorescence of certain substances, especially in minerals and impure inorganic chemicals. Fluorescence may be affected by purity, age and source of the compound, particle size, water-content, and the solvent and concentration of solute. A great many substances, however, emit characteristic fluorescence which serves for detection and estimation in extremely small amounts, particularly after treatment with solvents, acids, or alkalis. The science of fluorochemistry embraces the applications of fluorescence and ultraviolet light to chemistry. The references should be consulted for additional details on fluorescent chemicals and fluorochemical analysis.

The following table gives the character of fluorescence for various substances when excited by radiation of wave length 3650 angstrom units, except where otherwise noted.

Key to Abbreviations

acet.	acetone	KOH..	potassium hydroxide
alk	alkalis, alkaline	l....	light
al	ethyl alcohol	m..	medium

COLORIMETRY

Selected from Judd, Jour. Opt. Soc. Amer. **23**, 359 (1933)

Recommendations of the International Commission on Illumination

Standard Illuminants

A. Gas-filled tungsten incandescent lamp of color temperature 2848° K.

B. Noon Sunlight. Lamp as above in combination with the Davis-Gibson filter for converting color temperature 2848° to 4800° K.

The filter is to be composed of a layer one centimeter thick of each of two separate solutions B₁ and B₂, contained in a double cell of colorless optical glass.

Solution B₁

Copper sulphate (CuSO ₄ ·5H ₂ O)	2.452 g
Mannite (C ₆ H ₅ (OH) ₆)	2.452 g
Pyridine (C ₅ H ₅ N)	30.0 cc
Distilled water to make	1000 cc

Solution B₂

Cobalt ammonium sulphate (CoSO ₄ ·(NH ₄) ₂ SO ₄ ·6H ₂ O)	21.71 g
Copper sulphate (CuSO ₄ ·5H ₂ O)	16.11 g
Sulphuric acid (density 1.835)	10.0 cc
Distilled water to make	1000 cc

C. Average Daylight. Lamp as in A in combination with Davis-Gibson filter for converting color temperature 2848° to 6500° K.

The filter is composed of a layer one centimeter thick of each of two separate solutions C₁ and C₂, contained in a double cell made of colorless optical glass.

Solution C₁

Copper sulphate (CuSO ₄ ·5H ₂ O)	3.412 g
Mannite (C ₆ H ₅ (OH) ₆)	3.412 g
Pyridine (C ₅ H ₅ N)	30.0 cc
Distilled water to make	1000 cc

Solution C₂

Cobalt ammonium sulphate (CoSO ₄ ·(NH ₄) ₂ SO ₄ ·6H ₂ O)	30.580 g
Copper sulphate (CuSO ₄ ·5H ₂ O)	22.520 g
Sulphuric acid (density 1.835)	10.0 cc
Distilled water to make	1000 cc

See R. Davis and K. S. Gibson Bur. Stds. Misc. Pub. No. 114, Jan 1931 or Bur. Stds. Jour. Research **7**, 796 (1931).

Standard Coordinate System

The tristimulus system of color specification is based on four chosen stimuli consisting of homogeneous radiant energy of wave lengths

700.0 546.1 435.8

mμ and of standard illuminant B (see above).

To establish the system of specification coordinates are assigned as follows:

Stimulus	<i>x</i>	<i>y</i>	<i>z</i>
700.0 mμ	0.73467	0.26533	0.00000
546.1 mμ	0.27376	0.71741	0.00883
435.8 mμ	0.16658	0.00886	0.82456
Standard illuminant B:	0.34842	0.35161	0.29997

The Standard Observer

The "standard observer" is determined below by the specification for the equal energy spectrum both in fractions, x, y, z of the total amount for each wave length interval of 5 m μ and directly $\bar{x}, \bar{y}, \bar{z}$. The fractional values are known as the **trilinear coordinates** or **trichromatic coefficients** of the spectrum; the direct values as the **distribution functions** or coefficients.

The sum of the trichromatic coefficients is unity, that is $x + y + z = 1$. Therefore the value of z may be and often is omitted from a specification.

Relative Visibility

The value of \bar{y} given in the table is the standard visibility function or relative visibility

Wave length m μ	Trichromatic coefficients			Distribution coefficients for equal energy			Wave length m μ
	x	y	z	\bar{x}	\bar{y} (Rel. Vis.)	\bar{z}

SPECIFIC ROTATION

Specific rotation or rotatory power is given in degrees per decimeter for liquids and solutions and in degrees per millimeter for solids; + signifies right handed rotation, - left. Specific rotation varies with the wave length of light used, with temperature and, in the case of solutions, with the concentration. When sodium light is used, indicated by D in the wave length column, a value of $\lambda = 0.5893$ may be assumed.

Optical rotatory power for a large number of organic compounds will be found in the International Critical Tables, Vol. VII, for sugars, Vol. II.

* Varies greatly with temperature, solvent, and conc.

MAGNETO-OPTIC ROTATION

Revised by Park L. Turrill

$$\text{Verdet's Constant: } \rho = \frac{\alpha}{tH \cos \theta}$$

The specific power of magnetic rotation ρ , is expressed in the above formula, where α is the total angle of rotation in minutes, t the thickness of the substance in centimeters through which the light beam passes, H the magnetic field intensity in gauss, and θ the angle between the direction of the magnetic field and the path of light. Determinations made with sodium light. $\lambda_D = 5893 \text{ \AA}$.

Values from the Smithsonian Tables, the International Critical Tables, and the literature.

DEFINITIONS AND FORMULAE

The chemical terms have been compiled with the collaboration of
B. Clifford Hendricks

A compilation of chemical and physical terms including **quantities, units, laws, theories and effects**, with their expression as **formulae or equations**.

Abegg's rule.—For use in regard to a helical periodic system If the maximum positive valence exhibited by an element be numerically added to its maximum negative valence, there is evidently a tendency for the sum to equal 8. This tendency is exhibited especially by the elements of the 4th, 5th, 6th and 7th groups and is known as Abegg's rule.

Absolute humidity.—See *Humidity*

Absolute pressure.—See *Pressure*

Absolute temperature.—Temperature reckoned from the absolute zero See *Temperature*

Absolute units.—A system of units based on the smallest possible number of independent units. Specifically, units of force, work, energy and power not derived from or dependent on gravitation

Absolute zero.—The temperature at which a gas would show no pressure if the general law for gases would hold for all temperatures It is equal to -273.18°C or -459.72°F

Absorption.—1 Penetration of a substance into the body of another 2 Transformation into other forms suffered by radiant energy passing through a material substance

Absorption coefficient.—See *Absorption factor*

Absorption factor.—The ratio of the intensity loss by absorption to the total original intensity of radiation If I_o represents the original intensity, I_r , the intensity of reflected radiation, I_t , the intensity of the transmitted radiation, the absorption factor is given by the expression

$$\frac{I_o - (I_r + I_t)}{I_o}$$

Also called coefficient of absorption

Absorption, Lambert's law.—If I_o is the original intensity, I the intensity after passing through a thickness x of a material whose absorption coefficient is k ,

$$I = I_o e^{-kx}$$

The **index of absorption** k' is given by the relation $k = (4\pi k'n)/\lambda$ where n is the index of refraction and λ the wave length in vacuo. The **mass absorption** is given by k/d when d is the density The transmission factor is given by I/I_o .

Absorption spectrum.—The spectrum obtained by the examination of light from a source, itself giving a continuous spectrum, after this light has passed through an absorbing medium in the gaseous state. The absorption spectrum will

DEFINITIONS AND FORMULAE (Continued)

consist of dark lines or bands, being the reverse of the emission spectrum of the absorbing substance.

When the absorbing medium is in the solid or liquid state the spectrum of the transmitted light shows broad dark regions which are not resolvable into lines and have no sharp or distinct edges

Absorptive power or absorptivity for any body is measured by the fraction of the radiant energy falling upon the body which is absorbed or transformed into heat. This ratio varies with the character of the surface and the wave length of the incident energy. It is the ratio of the radiation absorbed by any substance to that absorbed under the same conditions by a black body

Acceleration.—The time rate of change of velocity in either speed or direction. Cgs unit,—one centimeter per second per second. Dimensions,— $[l t^{-2}]$. See also under *Angular acceleration*

Acceleration due to gravity.—The acceleration of a body freely falling in a vacuum. The International Committee on Weights and Measures has adopted as a standard or accepted value, 980 665 cm/sec² or 32 174 ft /sec²

Acceleration due to gravity at any latitude and elevation.—If ϕ is the latitude and H the elevation in centimeters the acceleration in cgs units is, $g = 980.616 - 2.5928 \cos 2\phi + 0.0069 \cos^2 2\phi - 3.086 \times 10^{-6} H$ (Helmert's equation)

Achromatic.—A term applied to lenses signifying their more or less complete correction for chromatic aberration

Acids are substances whose molecules ionize in water solution to give the hydrogen ion from their constituent elements. The strength of an acid is proportional to the concentration of hydrogen ions present

Action is measured by the product of work by time. Cgs units of action are the erg-second and the joule-second. Dimensions,— $[m l^2 t^{-1}]$. Planck's quantum or constant of action is 6.554×10^{-27} erg-seconds

Active mass of a substance is the number of gram molecular weights per liter in solution, or in gaseous form

Adiabatic.—A body is said to undergo an adiabatic change when its condition is altered without gain or loss of heat. The line on the pressure volume diagram representing the above change is called an adiabatic line

Adsorption.—The condensation of gases, liquids, or dissolved substances on the surfaces of solids is called adsorption

Air columns, frequency of vibration in —See *Organ pipes*

Allotropy.—The property shown by certain elements of being capable of existence in more than one form, due to differences in the arrangement of atoms or molecules (See *Monotropic* and *Enantiotropic*)

DEFINITIONS AND FORMULAE (Continued)

Alpha (α)-particle.—A helium nucleus—that is, a helium atom which has lost two electrons and has therefore a double positive charge.

Alpha (α)-rays are strongly ionizing and weakly penetrating radiations, deflected by magnetic and electric fields as positively charged particles. The particles are doubly charged helium atoms (ions) and are called α -particles.

Alternating current in circuits including resistance and inductance,

$$I = \frac{E}{\sqrt{R^2 + (2\pi fL)^2}}$$

where f is the frequency in cycles per second, L the inductance in henry. I will be given in effective amperes if R is in ohms and E in effective volts. The denominator is known as the impedance of the circuit.

For circuits involving also a capacitance C in farads, the impedance becomes,

$$\sqrt{R^2 + \left(2\pi fL - \frac{1}{2\pi fC}\right)^2}$$

Altitudes with the barometer.—If b_1 and b_2 denote the corrected barometer readings at two stations, t the mean of the temperatures, t_1 and t_2 of the air at the two stations, e_1 and e_2 the tension of water vapor at the two stations, h the mean height above sea level, ϕ the latitude; then the difference in elevation in centimeters is $H = 1,843,000 (\log b_1 - \log b_2) (1 + 0.00367t) (1 + 0.0026 \cos 2\phi + 0.00002h + \frac{3}{8}k)$, where

$$k = \frac{1}{2} \left(\frac{e_1}{b_1} + \frac{e_2}{b_2} \right)$$

An approximate formula, sufficient for differences not over 1000 meters is

$$H = 1,600,000 \frac{b_1 - b_2}{b_1 + b_2} (1 + 0.004t).$$

Amorphous.—Without definite form, not crystallized.

Ampere's rule.—To determine the direction in which the magnetic needle is deflected by a conductor carrying a current in a given direction.

If a man is imagined to be swimming in the direction in which the current is flowing, and facing the magnetic needle; then the north pole will be deflected toward his left hand, the south pole being deflected in the opposite direction.

Amplitude.—The maximum value of the displacement in an oscillatory motion.

Angle.—The ratio between the arc and the radius of the arc. Units of angle,—the radian, the angle subtended by an arc equal to the radius; the degree, $\frac{1}{360}$ part of the total angle about a point. Dimensions,—a numeric.

DEFINITIONS AND FORMULAE (Continued)

Angular acceleration.—The time rate of change of angular velocity either in angular speed or in direction of the axis of rotation (precession). (Cgs unit,—one radian per second per second. Dimensions,— $[t^{-2}]$).

If the initial angular velocity is ω_0 , and the velocity after time t is ω_t , the angular acceleration,

$$\alpha = \frac{\omega_t - \omega_0}{t}$$

The angular velocity after time t ,

$$\omega_t = \omega_0 + \alpha t$$

The angle swept out in time t ,

$$\theta = \omega_0 t + \frac{1}{2} \alpha t^2$$

The angular velocity after movement through the arc θ ,

$$\omega = \sqrt{\omega_0^2 + 2\alpha\theta}$$

In the above equations, for angular displacement in radians, angular velocity will be in radians per second and angular acceleration in radians per second per second.

Angular aperture of an objective is the largest angular extent of wave surface which it can transmit.

Angular harmonic motion or harmonic motion of rotation.—Periodic, oscillatory angular motion in which the restoring torque is proportional to the angular displacement. Torsional vibration.

Angular momentum or moment of momentum.—Quantity of angular motion measured by the product of the angular velocity and the moment of inertia. (Cgs unit,—unnamed, its nature is expressed by g-cm²/sec. Dimensions,— $[m l^2 t^{-1}]$).

The angular momentum of a mass whose moment of inertia is I , rotating with angular velocity ω , is $I\omega$.

Angular velocity.—Time rate of angular motion about an axis. (Cgs unit,—one radian per second. Dimensions,— $[t^{-1}]$).

If the angle described in time t is θ , the angular velocity,

$$\omega = \frac{\theta}{t}$$

θ in radians and t in seconds gives ω in radians per second.

Anhydride (of acid or base) —An oxide which when combined with water gives an acid or base.

Anion.—A negatively charged ion.

Apochromat.—A term applied to photographic and microscope objectives indicating the highest degree of color correction.

Archimedes principle.—A body wholly or partly immersed in a fluid is buoyed up by a force equal to the weight of the

DEFINITIONS AND FORMULAE (Continued)

fluid displaced. A body of volume V cm³ immersed in a fluid of density ρ grams per cm³ is buoyed up by a force in dynes,

$$F = \rho g V.$$

where g is the acceleration due to gravity.

A floating body displaces its own weight of liquid.

Area, unit of.—The square centimeter. The area of a square whose sides are one centimeter in length. Other units of area are similarly derived. Dimensions,—[²].

Arrhenius theory of electrolytic dissociation states that the molecule of an electrolyte can give rise to two or more electrically charged atoms or ions.

Astigmatism is an error of spherical lenses peculiar to the formation of images by oblique pencils. The image of a point when astigmatism is present will consist of two focal lines at right angles to each other and separated by a measurable distance along the axis of the pencil. The error is not eliminated by reduction of aperture as is spherical aberration.

Atom.—The smallest part of an element which can participate in ordinary chemical changes. The atoms of a given element are unvarying in average mass, but are different in such mass from atoms of all other elements.

Atomic number.—The number of excess positive charges on the atomic nucleus. This charge of the nucleus is the essential feature which distinguishes one element from another and determines the position of the element in the periodic table.

Atomic theory.—All elementary forms of matter are composed of very small unit quantities called atoms. The atoms of a given element all have the same size and weight. The atoms of different elements have different sizes and weights. Atoms of the same or different elements unite with each other to form very small unit quantities of compound substances called molecules.

Atomic weight is the relative weight of the atom, on the basis of oxygen as 16. If these weights are expressed in grams they are called gram atomic weights.

Avogadro's law.—Equal volumes of different gases at the same pressure and temperature contain the same number of molecules.

Avogadro's number.—The number of molecules in a mole or in a mass in grams of substance equal numerically to its molecular weight, i.e., 6.02×10^{23} molecules.

Avogadro's principle (or theory).—The numbers of molecules present in equal volumes of gases at the same temperature and pressure are equal.

Babo's law.—The addition of a non-volatile solid to a liquid in which it is soluble lowers the vapor pressure of the solvent in proportion to the amount of substance dissolved.

DEFINITIONS AND FORMULAE (Continued)

Balanced or reversible action.—One which can be caused to proceed in either direction by suitable variation in the conditions of temperature, volume, pressure or of the quantities of reacting substances.

Balmer series of spectral lines. The wave lengths of a series of lines in the spectrum of hydrogen are given in angstroms by the equation

$$\lambda = 3646 \frac{N^2}{N^2 - 4}$$

where N is an integer having values greater than 2.

Bases are substances which ionize in water to give the hydroxyl ion from their constituent elements. The strength of a base is proportional to the concentration of hydroxyl ions.

Beats.—Two tones of slightly different frequencies sounded together interfere to give a sound of regularly varying intensity. The number of beats per second is the difference in frequency of the two tones.

Beer's law (1852).—If two solutions of the same salt be made in the same solvent, one of which is, say, twice the concentration of the other, the absorption due to a given thickness of the first solution should be equal to that of twice the thickness of the second.

Bernoulli's theorem.—At any point in a tube through which a liquid is flowing the sum of the pressure energy, potential energy, and kinetic energy is constant. If p is pressure; h , height above a reference plane; d , density of the liquid, and v , velocity of flow,

$$p + hdg + \frac{1}{2} dv^2 = \text{a constant.}$$

Berthelot principle of maximum work.—Of all possible chemical processes which can proceed without the aid of external energy, that process always takes place which is accompanied by the greatest evolution of heat. This law holds good for low temperatures only and does not account for endothermic reactions.

Beta (β)-particle.—One of the products emitted from the atomic nuclei of radioactive substances during their spontaneous disintegration. A negatively charged particle, which at rest has a mass about $\frac{1}{1845}$ that of a hydrogen atom. An electron.

Beta (β)-rays.—A radiation, more penetrating but less ionizing than α -rays. The rays are deflected by electric and magnetic fields as negatively charged particles. The particles consist of high speed electrons.

Black body.—If, for all values of the wave length of the incident radiant energy, all of the energy is absorbed the body is called a black body.

Boyle's law for gases.—At a constant temperature the volume of a given quantity of any gas varies inversely as the pressure to which the gas is subjected. For a perfect gas,

DEFINITIONS AND FORMULAE (Continued)

changing from pressure p and volume v to pressure p' and volume v' without change of temperature,

$$pv = p'v'$$

Bulk modulus.—The modulus of volume elasticity,

$$M_B = \frac{p_2 - p_1}{\frac{v_1 - v_2}{v_1}}$$

where $p_1, p_2; v_1, v_2$ are the initial and final pressure and volume respectively.

Brewster's law.—The tangent of the polarizing angle for a substance is equal to the index of refraction. The polarizing angle is that angle of incidence for which the reflected polarized ray is at right angles to the refracted ray. If n is the index of refraction and θ the polarizing angle, $n = \tan \theta$.

Brightness is measured by the flux emitted per unit emissive area as projected on a plane normal to the line of sight. The unit of brightness is that of a perfectly diffusing surface giving out one lumen per square centimeter of projected surface and is called the lambert. The millilambert (0.001 lambert) is a more convenient unit. **Candle per square centimeter** is the brightness of a surface which has, in the direction considered, a luminous intensity of one candle per cm^2 .

Brownian movement.—A continuous agitation of particles in a colloidal solution caused by unbalanced impacts with molecules of the surrounding medium. The motion may be observed with a microscope when a strong beam of light is caused to traverse the solution across the line of sight.

Capacitance is measured by the charge, which must be communicated to a body to raise its potential one unit. Electrostatic unit capacitance is that which requires one electrostatic unit of charge to raise the potential one electrostatic unit. The farad = 9×10^{11} electrostatic units. A capacitance of one farad requires one coulomb of electricity to raise its potential one volt. Dimensions,— $[\epsilon l]; [\mu^{-1} l^{-1} t^2]$.

A conductor charged with a quantity Q to a potential V has a capacitance,

$$C = \frac{Q}{V}$$

Capacitance of a spherical conductor of radius r ,

$$C = Kr$$

Capacitance of two concentric spheres of radii r and r'

$$C = K \frac{rr'}{r - r'}$$

Capacitance of a parallel plate condenser, the area of whose plates is A and the distance between them d ,

$$C = \frac{KA}{4\pi d}$$

DEFINITIONS AND FORMULAE (Continued)

Capacitances will be given in electrostatic units if the dimensions of condensers are substituted in cm. K is the dielectric constant of the medium.

Capillary constant or specific cohesion,

$$a^2 = \frac{2T}{(d_1 - d_2)g} = hr$$

where T is surface tension, d_1 and d_2 , the densities of the two fluids, g the acceleration due to gravity, h the height of rise in a capillary tube of radius r . See *Surface tension*.

Carnot cycle.—A sequence of operations forming the working cycle of an ideal heat engine of maximum thermal efficiency. It consists of isothermal expansion, adiabatic expansion, isothermal compression, and adiabatic compression to the initial state.

Catalytic agent.—A substance which by its mere presence alters the velocity of a reaction, and may be recovered unaltered in nature or amount at the end of the reaction.

Cation.—A positively charged ion.

Cauchy's dispersion formula.

$$n = A + \frac{B}{\lambda^2} + \frac{C}{\lambda^4} + \dots$$

An empirical expression giving an approximate relation between the refractive index n of a medium and the wavelength λ of the light, A , B , and C being constants for a given medium.

Centripetal force.—The force required to keep a moving mass in a circular path. Centrifugal force is the name given to the reaction against centripetal force.

Charles' law or Gay-Lussac's law.—The volumes assumed by a given mass of a gas at different temperatures, the pressure remaining constant, are, within moderate ranges of temperature, directly proportional to the corresponding absolute temperatures.

Chromatic aberration.—Due to the difference in the index of refraction for different wave lengths, light of various wave lengths from the same source cannot be focused at a point by a simple lens. This is called chromatic aberration.

Chemiluminescence.—Emission of light during a chemical reaction.

Christiansen effect.—When finely powdered substances, such as glass or quartz, are immersed in a liquid of the same index of refraction complete transparency can only be obtained for monochromatic light. If white light is employed the transmitted color corresponds to the particular wave-length for which the two substances, solid and liquid have exactly the same index of refraction. Due to differences in dispersion the indices of refraction will match for only a narrow band of the spectrum.

DEFINITIONS AND FORMULAE (Continued)

Colligative property.—A property numerically the same for a group of substances, independent of their chemical nature.

Colloid.—A phase dispersed to such a degree that the surface forces become an important factor in determining its properties.

Coma.—An aberration of spherical lenses, occurring in the case of oblique incidence, when the bundle of rays forming the image is unsymmetrical. The image of a point is comet shaped, hence the name.

Combining volumes.—Under comparable conditions of pressure and temperature the volume ratios of gases involved in chemical reactions are simple whole numbers.

Combining weight of an element or radical is its atomic weight divided by its valence.

Combining weights, law of.—If the weights of elements which combine with each other be called their "combining weights," then elements always combine either in the ratio of their combining weights or of simple multiples of these weights.

Component substances, law of.—Every material consists of one substance, or is a mixture of two or more substances, each of which exhibits a specific set of properties, independent of the other substances.

Compounds are substances containing more than one constituent element and having properties, on the whole, different from those which their constituents had as elementary substances. The composition of a given pure compound is perfectly definite, and is always the same no matter how that compound may have been formed.

Compressibility.—Reciprocal of the bulk modulus.

Concentration.—The amount of a substance in weight, moles, or equivalents contained in unit volume.

Condensers in parallel and series.—If c_1, c_2, c_3 , etc. represent the capacitances of a series of condensers and C their combined capacitance,—

when in parallel, $C = c_1 + c_2 + c_3 \dots$

when in series, $\frac{1}{C} = \frac{1}{c_1} + \frac{1}{c_2} + \frac{1}{c_3} \dots$

Conductance, the reciprocal of resistance, is measured by the ratio of the current flowing through a conductor to the difference of potential between its ends. The practical unit of conductance, the mho, the conductance of a body through which one ampere of current flows when the potential difference is one volt. The conductance of a body in mho is the reciprocal of the value of its resistance in ohms. Dimensions,— $[e / t^{-1}]$; $[\mu^{-1} l^{-1} t]$.

DEFINITIONS AND FORMULAE (Continued)

Conductivity, electrical, is measured by the quantity of electricity transferred across unit area, per unit potential gradient per unit time. Reciprocal of resistivity. **Volume conductivity** or specific conductance, $k = 1/\rho$ where ρ is the volume resistivity. **Mass conductivity** $= k/d$ where d is density. **Equivalent conductivity** $\Lambda = k/c$ where c is the number of equivalents per unit volume of solution. **Molecular conductivity** $\mu = k/m$ where m is the number of moles per unit volume of solution. Dimensions: volume conductivity,— $[\epsilon t^{-1}]$; $[\mu^{-1} l^{-2} t]$,—mass conductivity,— $[\epsilon m^{-1} l^3 t^{-1}]$; $[\mu^{-1} m^{-1} l]$.

Conductivity, thermal.—Time rate of transfer of heat by conduction, through unit thickness, across unit area for unit difference of temperature. It is measured as calories per second per square centimeter for a thickness of one centimeter and a difference of temperature of 1°C . Dimensions,— $[m l t^{-3} \theta^{-1}]$.

If the two opposite faces of a rectangular solid are maintained at temperatures t_1 and t_2 the heat conducted across the solid of section a and thickness d in a time T will be,

$$Q = \frac{K(t_2 - t_1) a T}{d}$$

K is a constant depending on the nature of the substance, designated as the specific heat conductivity. K is usually given for Q in calories, t_1 and t_2 in $^\circ\text{C}$, a in cm^2 , T in sec, and d in cm. See table *Heat conductivity*.

Conductors.—A class of bodies which are incapable of supporting electric strain. A charge given to a conductor spreads to all parts of the body.

Conjugate foci.—Under proper conditions light divergent from a point on or near the axis of a lens or spherical mirror is focused at another point. The point of convergence and the position of the source are interchangeable and are called conjugate foci.

Conservation of energy. (Chem).—In a chemical change there is no loss or gain but merely a transformation of energy from one form to another.

Conservation of energy, law of.—Energy can neither be created nor destroyed and therefore the total amount of energy in the universe remains constant.

Conservation of momentum, law of.—For any collision, the vector sum of the momenta of the colliding bodies after collision equals the vector sum of their momenta before collision. If two bodies of masses m_1 and m_2 have, before impact velocities v_1 and v_2 and after impact velocities u_1 and u_2 .

$$m_1 u_1 + m_2 u_2 = m_1 v_1 + m_2 v_2$$

Conservation of mass.—In all ordinary chemical changes, the total of the reactants is always equal to the total mass of the products.

Constitutive property.—A property which depends on the constitution or structure of the molecule.

DEFINITIONS AND FORMULAE (Continued)

Couple.—Two equal and oppositely directed parallel but not colinear forces acting upon a body form a couple. The moment of the couple or torque is given by the product of one of the forces by the perpendicular distance between them. Dimension,— $[m l^2 t^{-2}]$.

Couple acting on a magnet of magnetic moment ml in a field of strength H . If the magnet is perpendicular to the direction of the field

$$C = Hml = HM$$

If the angle between the magnet and the field is θ

$$C = Hml \sin \theta$$

The couple will be in dyne-cm for cgs electromagnetic units of H , m and l .

Cryohydrate.—The solid which separates when a saturated solution freezes. It contains the solvent and the solute in the same proportions as they were in the saturated solution.

Crystal.—A homogeneous portion of a substance bounded by plane surfaces making definite angles with each other, giving a regular geometrical form.

Critical temperature is that temperature above which a gas cannot be liquefied by pressure alone. The pressure under which a substance may exist as a gas in equilibrium with the liquid at the critical temperature is the **critical pressure**.

Curie's law.—The intensity of magnetization,

$$I = \frac{AH}{T}$$

where H , is the magnetic field strength, T the absolute temperature and A Curie's constant. Used for paramagnetic substances.

Curie point.—All ferro-magnetic substances have a definite temperature of transition at which the phenomena of ferro-magnetism disappear and the substances becomes merely paramagnetic. This temperature is called the "Curie Point" and is usually lower than the melting point.

Current (electric).—The rate of transfer of electricity. The transfer at the rate of one electrostatic unit of electricity in one second is the electrostatic unit of current. The electromagnetic unit of current is a current of such strength that one centimeter of the wire in which it flows is pushed sideways with a force of one dyne when the wire is at right angles to a magnetic field of unit intensity. The practical unit of current is the **ampere**, a transfer of one coulomb per second, which is one tenth the electromagnetic unit. The **international ampere** is the unvarying electric current which, when passed through a solution of silver nitrate in accordance with certain specifications, deposits silver at the rate of 0.00111800 gram per second. The international ampere is equivalent to 0.99991 absolute ampere. The **ampere-turn** is the magnetic potential

DEFINITIONS AND FORMULAE (Continued)

produced between the two faces of a coil of one turn carrying one ampere. Dimensions,— $[e^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$.

Current in a simple circuit.—The current in a circuit including an external resistance R and a cell of electromotive force E and internal resistance r ,

$$I = \frac{E}{R + r}$$

If E is in volts and r and R in ohms the current will be in amperes.

For two cells in parallel,

$$I = \frac{E}{R + \frac{r}{2}}$$

For two cells in series,

$$I = \frac{2E}{R + 2r}$$

Dalton's law of partial pressures.—The pressure exerted by a mixture of gases is equal to the sum of the separate pressures which each gas would exert if it alone occupied the whole volume. This fact is expressed in the following formula:

$$PV = V(p_1 + p_2 + p_3, \text{etc.})$$

Declination.—The angle between the vertical plane containing the direction of the earth's field at any point and a plane containing the geographic north and south meridian.

Decomposition is the chemical separation of a substance into two or more substances, which may differ from each other and from the original substances.

Definite proportions, law of.—In every sample of each compound substance the proportions by weight of the constituent elements are always the same.

Degree of freedom.—The number of the variables determining the state of a system (usually pressure, temperature, and concentrations of the components) to which arbitrary values can be assigned.

Density.—Concentration of matter, measured by the mass per unit volume. Dimensions,— $[m l^{-3}]$.

Dew point.—The temperature at which condensation of water vapor in the air takes place.

Diamagnetic bodies tend to set the longest dimension across the magnetic field. The permeability of a diamagnetic substance is less than unity.

Dielectric constant of a medium is defined by ϵ in the equation

$$F = \frac{QQ'}{\epsilon r^2}$$

DEFINITIONS AND FORMULAE (Continued)

where F is the force of attraction between two charges Q and Q' separated by a distance r in a uniform medium.

Dielectrics or insulators or non-conductors.—A class of bodies supporting an electric strain. A charge on one part of a non-conductor is not communicated to any other part.

Diffraction.—If the light source were a point, the shadow of any object would have its maximum sharpness; a certain amount of illumination, however, would be found within the geometrical shadow due to the diffraction of the light at the edge of the object.

Diffraction grating.—If s is the distance between the rulings, d the angle of diffraction, then the wave length where the angle of incidence is 90° is (for the n th order spectrum),

$$\lambda = \frac{s \sin d}{n}$$

If i is the angle of incidence, d the angle of diffraction, s the distance between the rulings, n the order of the spectrum, the wave length is,

$$\lambda = \frac{s}{n} (\sin i + \sin d).$$

Diffusion.—If the concentration (mass of solid per unit volume of solution) at one surface of a layer of liquid is d_1 and at the other surface d_2 , the thickness of the layer h and the area under consideration A , then the mass of the substance which diffuses through the cross-section A in time t is,

$$m = \Delta A \frac{(d_2 - d_1)t}{h}$$

where Δ is the coefficient of diffusion.

Diffusivity or coefficient of diffusion is also given by Δ in the equation

$$\frac{dQ}{dt} = -\Delta \left(\frac{dc}{dx} \right) dy dz$$

where dQ is the amount passing through an area $dy dz$ in the direction of x in a time dt where dc/dx is the rate of increase of volume concentration in the direction of x . Dimensions,— $[l^2 t^{-1}]$.

Diffusivity of heat is given by Δ in the equation

$$\frac{dH}{dt} = -\Delta s d \frac{dT}{dx} dy dz$$

where dH is the quantity of heat passing through the area $dy dz$ in the direction of x in a time dt . The rate of variation of temperature along x is given by dT/dx , s is specific heat and d , density. Dimensions,— $[l^2 t^{-1}]$.

Dimensional formulae.—If mass, length, and time are considered fundamental quantities, the relation of other physical quantities and their units to these three may be expressed by a formula involving the symbols l , m and t respectively, with appropriate exponents. For example: the dimensional formula

DEFINITIONS AND FORMULAE (Continued)

for volume would be expressed,—[l^3]; velocity,—[lt^{-1}]; force—[mlt^{-2}]. Other fundamental quantities used in dimensional formulae may be indicated as follows: θ , temperature; ϵ the dielectric constant of a vacuum; μ , the magnetic permeability of a vacuum.

Diminution of pressure at the side of a moving stream.

If a fluid of density d moves with a velocity v , the diminution of pressure due to the motion is (neglecting viscosity),

$$p = \frac{1}{2} dv^2$$

Dip.—The angle measured in a vertical plane between the direction of the earth's magnetic field and the horizontal.

Dispersion.—The difference between the index of refraction of any substance for any two wave lengths is a measure of the dispersion for these wave lengths, called the coefficient of dispersion.

Dispersive power.—If n_1 and n_2 are the indices of refraction for wave lengths λ_1 and λ_2 and n the mean index or that for sodium light, the dispersive power for the specified wave length is,

$$\omega = \frac{n_2 - n_1}{n - 1}$$

Displacement is a reaction in which an elementary substance displaces and sets free a constituent element from a compound.

Displacement or elongation at any instant. The distance of a vibrating or oscillating particle from its position of equilibrium.

Distribution law.—A substance distributes itself between two immiscible solvents so that the ratio of its concentrations in the two solvents is approximately a constant (and equal to the ratio of the solubilities of the substance in each solvent). Requires modification if more than one molecular species is formed.

Doppler effect. (Light).—The apparent change in the wave-length of light produced by the motion in the line of sight of either the observer or the source of light.

Doppler's principle.—The apparent frequency of a sound as affected by motion of the hearer, the source and the medium is given by the following expression,

$$n = n_o \frac{V + w - v_o}{V + w - v}$$

where n_o is the original frequency of the source, V the velocity of sound, w that of the medium, v_o that of the observer and v that of the source. Only the components of motion parallel to the line connecting the source and observer are to be considered. All velocities are taken in the direction from the source to observer; if the motion is in the opposite direction the sign of the velocity substituted in the formula should be changed.

DEFINITIONS AND FORMULAE (Continued)

Double decomposition consists of a simple exchange of the parts of two substances to form two new substances.

Dulong and Petite, law of.—The specific heats of the several elements are inversely proportional to their atomic weights. The atomic heats of solid elements are constant and approximately equal to 6.3. Certain elements of low atomic weight and high melting point have, however, much lower atomic heats at ordinary temperatures.

Eddy current.—A current induced in a mass of conducting material by a varying magnetic field. Also called *Fourcault current*.

Edison effect.—The name first given (after its discoverer) to the phenomenon of electrical conduction between an incandescent filament and an independent cold electrode contained in the same envelope, when the second electrode is made positive with respect to the filament.

Elasticity.—The property by virtue of which a body resists and recovers from deformation produced by force.

Elastic limit.—The smallest value of the stress producing permanent alteration.

Elastic modull.

Young's modulus by stretching.—If an elongation s is produced by the weight of the mass m , in a wire of length l , and radius r , the modulus,

$$M = \frac{mgl}{\pi r^2 s}$$

Young's modulus by bending, bar supported at both ends. If a flexure s is produced by the weight of mass m , added midway between the supports separated by a distance l , for a rectangular bar with vertical dimensions of cross-section a and horizontal dimension b , the modulus is,

$$M = \frac{mgl^3}{4sa^3b}$$

For a cylindrical bar of radius r ,

$$M = \frac{mgl^3}{12\pi r^4 s}$$

For a bar supported at one end. In the case of a rectangular bar as described above,

$$M = \frac{4mgl^3}{sa^3b}$$

For a round bar supported at one end,

$$M = \frac{4mgl^3}{3\pi r^4 s}$$

Modulus of rigidity.—If a couple C ($= mgx$) produces a twist of θ radians in a bar of length l and radius r , the modulus is

$$M = \frac{2Cl}{\pi r^4 \theta}$$

DEFINITIONS AND FORMULAE (Continued)

The substitution in the above formulae for the elastic coefficients of m in grams, g in cm per sec², l , a , b , and r in cm, s in cm, and C in dyne-cm will give moduli in dynes per cm². The dimensions of elastic moduli are the same as of stress,— $[m\ l^{-1}\ t^{-2}]$.

Coefficient of restitution.—Two bodies moving in the same straight line, with velocities v_1 and v_2 respectively, collide and after impact move with velocities v_3 and v_4 . The coefficient of restitution is

$$C = \frac{v_4 - v_3}{v_2 - v_1}$$

Electric field intensity is measured by the force exerted on unit charge. Unit field intensity is the field which exerts the force of one dyne on unit positive charge. Dimensions,— $[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{-\frac{1}{2}}\ t^{-1}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}]$.

The field intensity or force exerted on unit charge at a point distant r from a charge q in a vacuum

$$H = \frac{q}{r^2}$$

If the dielectric in the above cases is not a vacuum the dielectric constant ϵ must be introduced. The formula becomes

$$H = \frac{q}{\epsilon r^2}$$

The value of ϵ is frequently considered unity for air. If the dielectric constant of a vacuum is considered unity the value for air at 0°C and 760 mm pressure is 1.000576.

Electrolysis.—If a current i flows for a time t and deposits a metal whose electrochemical equivalent is e , the mass deposited is

$$m = e i t$$

The value of e is usually given for mass in grams, i in amperes and t in seconds.

Electrochemical equivalent of an ion is the mass liberated by the passage of unit quantity of electricity.

Electromotive force is defined as that which causes a flow of current. The electromotive force of a cell is measured by the maximum difference of potential between its plates. The electromagnetic unit of potential difference is that against which one erg of work is done in the transfer of electromagnetic unit quantity. The **volt** is that potential difference against which one joule of work is done in the transfer of one coulomb. One volt is equivalent to 10^8 electromagnetic units of potential. The **international volt** is the electrical potential which when steadily applied to a conductor whose resistance is one international ohm will cause a current of one international ampere to flow. The international volt = 1.00043 absolute volts. The electromotive force of a Weston standard cell is 1.0183 int. volts at 20°C. Dimensions,— $[\epsilon^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-1}]$; $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ l^{\frac{1}{2}}\ t^{-2}]$

DEFINITIONS AND FORMULAE (Continued)

Electrolytic dissociation or ionization theory.—When an acid, base or salt is dissolved in water or any other dissociating solvent, a part or all of the molecules of the dissolved substance are broken up into parts called ions, some of which are charged with positive electricity and are called cations, and an equivalent number of which are charged with negative electricity and are called anions.

Electrolytic solution tension theory (or the Helmholtz double layer theory).—When a metal, or any other substance capable of existing in solution as ions, is placed in water or any other dissociating solvent, a part of the metal or other substances passes into solution in the form of ions, thus leaving the remainder of the metal or substances charged with an equivalent amount of electricity of opposite sign from that carried by the ions. This establishes a difference in potential between the metal and the solvent in which it is immersed.

Electromotive series is a list of the metals arranged in the decreasing order of their tendencies to pass into ionic form by losing electrons.

Electron.—A very small negatively charged particle. Electrons appear to be uniform in mass and charge and to be one of the basic elements of which atoms are made. The charge of the electron is accepted as 4.80×10^{-10} absolute electrostatic unit.

Electron theory of matter.—An atom is believed to consist of a nucleus bearing a positive charge, different for each sort of atom, surrounded by electrons or negative charges equal in total charge to the positive charge of the nucleus. The nucleus may consist of a certain number of protons and neutrons. The electrons revolve as satellites around the nucleus.

The nucleus contains practically all of the mass of the atom, the number of protons and neutrons determining the atomic weight. The number and arrangement of satellite electrons determines the chemical properties of the atom.

Elements are substances which cannot be decomposed by the ordinary types of chemical change, or made by chemical union.

Emissive power or emissivity is measured by the energy radiated from unit area of a surface in unit time for unit difference of temperature between the surface in question and surrounding bodies. For the cgs system the emissive power is given in ergs per second per square centimeter with the radiating surface at 1° absolute and the surroundings at absolute zero. See *Radiation formula*.

Enantiotropic.—Crystal forms capable of existing in reversible equilibrium with each other.

Energy.—The capability of doing work. **Potential energy** is energy due to position of one body with respect to another or to the relative parts of the same body. **Kinetic energy**

DEFINITIONS AND FORMULAE (Continued)

is energy due to motion. Cgs units,—the erg, the energy expended when a force of one dyne acts through a distance of one centimeter; the joule is 1×10^7 ergs. Dimensions,— $[m l^2 t^{-2}]$.

The potential energy of a mass m , raised through a distance h , where g is the acceleration due to gravity is

$$E = mgh.$$

The kinetic energy of mass m , moving with a velocity v , is

$$E = \frac{1}{2}mv^2.$$

Energy will be given in ergs if m is in grams, g in cm per sec², h in cm and v in cm per sec.

Energy of a charge in ergs where Q is the charge and V the potential in electrostatic units.

$$E = \frac{1}{2}QV.$$

Energy of the electric field.—If H is the electric field intensity in electrostatic units and K the specific inductive capacity, the energy of the field in ergs per cm³ is

$$E = \frac{KH^2}{8\pi}.$$

Energy of rotation.—If a mass whose moment of inertia about an axis is I , rotates with angular velocity ω about this axis, the kinetic energy of rotation will be,

$$E = \frac{1}{2}I\omega^2$$

Energy will be given in ergs if I is in g-cm² and ω in radians per sec.

Entropy.—A quantity depending on the quantity of heat in a body and on its temperature, which, when multiplied by any lower temperature (minimum available), gives the unavailable energy, or unavoidable waste when mechanical work is derived from the heat energy of the body. Dimensions,— $[m l^2 t^{-2} \theta^{-1}]$.

Equilibrium, chemical.—A state of affairs in which a chemical reaction and its reverse reaction are taking place at equal velocities, so that the concentrations of reacting substances remain constant.

Equilibrium constant.—The product of the concentrations (or activities) of the substances produced at equilibrium in a chemical reaction divided by the product of concentrations of the reacting substances, each concentration raised to that power which is the coefficient of the substance in the chemical equation.

Equivalent weight or combining weight of an element or ion is its atomic or formula weight divided by its valence. Elements entering into combination always do so in quantities proportional to their equivalent weights.

Ettinghausen's effect (Von Ettinghausen's).—When an electric current flows across the lines of force of a magnetic

DEFINITIONS AND FORMULAE (Continued)

field an electromotive force is observed which is at right angles to both the primary current and the magnetic field: a temperature gradient is observed which has the opposite direction to the Hall electromotive force.

Eutectic.—A term applied to the mixture of two or more substances which has the lowest melting point.

Expansion of gases.

Charles' law or Gay-Lussac's law.—The volume of a gas at constant pressure increases proportionately to the absolute temperature. If V_1 and V_2 are volumes of the same mass of gas at absolute temperatures, T_1 and T_2 ,

$$\frac{V_1}{V_2} = \frac{T_1}{T_2}$$

For an original volume V_o at 0°C the volume at $t^\circ\text{C}$ (at constant pressure) is

$$V_t = V_o(1 + 0.00367t).$$

General law for gases.

$$p_t v_t = p_o v_o \left(1 + \frac{t}{273}\right)$$

where p_o , v_o , p_t , v_t represent the pressure and value at 0° and $t^\circ\text{C}$. or

$$\frac{p_1 v_1}{T_1} = \frac{p_2 v_2}{T_2}$$

where p_1 , v_1 and T_1 represent pressure volume and absolute temperature in one case and p_2 , v_2 and T_2 the same quantities for the same mass of gas in another.

The law may also be expressed:

$$pv = RmT$$

where m is the mass of gas at absolute temperature T . R is the **gas constant** which depends on the units used. **Boltzmann's molecular gas constant** is obtained by expressing m in terms of the number of molecules.

For volume in cm^3 , pressure in dynes per cm^2 and temperature in Centigrade degrees on the absolute scale $R = 8.3136 \times 10^7$.

Reduction of a gas volume to 0°C , 760 mm pressure.—

If V is the original volume of a gas at temperature t and pressure H , the volume at 0°C and 760 mm pressure will be,

$$V_o = \frac{V}{(1 + \alpha t)} \frac{H}{760}$$

if d is the original density the density at 0°C and 760 mm pressure will be

$$d_o = d(1 + \alpha t) \frac{760}{H}$$

$$\alpha = 0.00367 \text{ approximately.}$$

Falling bodies.—For bodies falling from rest conditions are as for uniformly accelerated motion except that $v_o = 0$ and

DEFINITIONS AND FORMULAE (Continued)

g is the acceleration due to gravity. The formulae become,—
air resistance neglected,

$$v_t = gt, s = \frac{1}{2}gt^2, v_s = \sqrt{2gs}.$$

For bodies projected vertically upward,—if v is the velocity of projection, the time to reach greatest height, neglecting the resistance of the air,

$$t = \frac{v}{g}$$

Greatest height,

$$h = \frac{v^2}{2g}$$

See also under *Projectiles*.

Faraday's laws.—In the process of electrolytic changes equal quantities of electricity charge or discharge equivalent quantities of ions at each electrode.

One gram equivalent weight of matter is chemically altered at each electrode for 96,500 coulombs, or one faraday, of electricity passed through the electrolyte.

Faraday effect.—The rotation of the plane of polarization produced when plane-polarized light is passed through a substance in a magnetic field, the light traveling in a direction parallel to the lines of force. For a given substance, the rotation is proportional to the thickness traversed by the light and to the magnetic field strength.

Fermat's principle of least time.—The path chosen by a ray joining two points is that which can be travelled over in the least possible time.

Fleming's rule.—A simple rule for relating the directions of the flux, motion, and e.m.f. in an electric machine. The forefinger, second finger and thumb, placed at right-angles to each other, represent respectively the directions of flux, e.m.f., and motion or torque. If the right hand is used the conditions are those obtaining in a generator and if the left hand is used the conditions are those obtaining in a motor.

Fluidity.—The reciprocal of viscosity. The cgs unit is the rho, the reciprocal of the poise. Dimensions,— $[m^{-1} l]$.

Force.—That which changes the state of rest or motion in matter, measured by the rate of change of momentum. Absolute unit,—the **dyne**, the force which will produce an acceleration of one centimeter per second per second in a gram mass. The gram weight or weight of a gram mass is the cgs gravitational unit. The poundal is that force which will give an acceleration of one foot per second to a pound mass. Dimensions,— $[m l t^{-2}]$.

The force F required to produce an acceleration a in a mass m is given by

$$F = ma.$$

DEFINITIONS AND FORMULAE (Continued)

If m is substituted in grams and a in cm per sec², F will be given in dynes.

Force between two charges, Coulomb's law.—If two charges q and q' are at a distance r in a vacuum, the force between them is,

$$F = \frac{qq'}{r^2}$$

The force will be given in dynes if q and q' are in electrostatic units and r in cm.

Force between two magnetic poles.—If two poles of strength m and m' are separated by a distance r in a medium whose permeability is μ (unity for a vacuum), the force between them is,

$$F = \frac{mm'}{\mu r^2}$$

Force will be given in dynes if r is in cm and m and m' are in cgs units of pole strength.

The strength of a magnetic field at a point distance r from an isolated pole of strength m is

$$H = \frac{m}{\mu r^2}$$

The field will be given in gauss if m and r are in cgs units.

Formula, chemical.—A combination of symbols with their subscripts representing the constituents of a substance and their proportions by weight.

Foucault's pendulum.—The rate of rotation in degrees per hour of a line on the surface of the earth relative to the plane of a Foucault's pendulum at latitude ϕ is,

$$\omega = 15 \sin \phi$$

Fraunhofer's lines.—When sunlight is examined through a spectroscope it is found that the spectrum is traversed by an enormous number of dark lines parallel to the length of the slit. These dark lines are known as Fraunhofer's lines. Kirchhoff conceived the idea that the sun is surrounded by layers of vapors which act as filters of the white light arising from incandescent solids within and which abstract those rays which correspond in their periods of vibration to those of the components of the vapors. Thus reversed or dark lines are obtained due to the absorption by the vapor envelop, in place of the bright lines found in the emission spectrum.

Frequency in uniform circular motion or in any periodic motion is the number of revolutions or cycles completed in unit time. Cgs units,—cycles per second. Dimension,— $[t^{-1}]$.

DEFINITIONS AND FORMULAE (Continued)

Frequency of vibrating strings.—The fundamental frequency of a stretched string is given by

$$n = \frac{1}{2l} \sqrt{\frac{T}{m}}$$

where l is the length; T , the tension and m the mass per unit length.

For a string or wire of circular section of length, l , tension T , density d , and radius r , the frequency of the fundamental is

$$n = \frac{1}{2rl} \sqrt{\frac{T}{\pi d}}$$

The frequency in vibrations per second will be given if T is in dynes, r and l in cm and d in g per cm³.

Friction, coefficient of.—The coefficient of friction between two surfaces is the ratio of the force required to move one over the other to the total force pressing the two together.

If F is the force required to move one surface over another and W , the force pressing the surfaces together, the coefficient of friction,

$$k = \frac{F}{W}.$$

Fundamental units.—See under *Mass, Length and Time*.

Gamma (γ) rays.—Highly penetrating radiations from radioactive substances, undeflected by electric or magnetic fields, representing a high frequency electromagnetic radiation. They have the same nature as X-rays but are of higher frequency.

Gas.—A state of matter in which the molecules are practically unrestricted by cohesive forces. A gas has neither definite shape nor volume.

Gas thermometer.—Where P_o , P_s and P_x represent the total pressure with the bulb at 0°C, at the boiling-point of water and at the unknown temperature respectively, t_s the temperature of steam and t_x the unknown temperature,

$$t_x = t_s \frac{P_x - P_o}{P_s - P_o}$$

(approximately). The total pressure on the gas in the bulb is the algebraic sum of barometric pressure at the time and that measured by the manometer.

Gay-Lussac's law.—See *Charles' law*.

Gay-Lussac's law of combining volumes.—If gases interact and form a gaseous product, the volumes of the reacting gases and the volumes of the gaseous products are to each other in simple proportions, which can be expressed by small whole numbers.

Gibbs' phase rule.— $F = C + 2 - P$. F , the number of degrees of freedom of a system, is the number of variable

DEFINITIONS AND FORMULAE (Continued)

factors (temperature, pressure and concentration) of the components, which must be arbitrarily fixed in order that the condition of the system may be perfectly defined. *C*, the number of the components of the system, is chosen equal to the smallest number of independently variable constituents by means of which the composition of each phase participating in the state of equilibrium can be expressed in the form of a chemical equation; the components must be chosen from among the constituents which are present when the system is in a state of true equilibrium and which take part in that equilibrium; as components are chosen the smallest number of such constituents necessary to express the composition of each phase participating in the equilibrium, zero and negative quantities of components being permissible; in any system the number of components is definite, but may alter with changes in conditions of experiment; a qualitative but not quantitative freedom of selection of components is allowed, the choice being influenced by suitability and simplicity of application. *P*, the number of phases of the system, are the homogeneous, mechanically separable and physically distinct portions of a heterogeneous system; the number of phases capable of existence varies greatly in different systems; there can never be more than one gas or vapor phase since all gases are miscible in all proportions, a heterogeneous mixture of solid substances forms as many phases as there are substances present.

Graham's law.—The relative rates of diffusion of gases under the same conditions are inversely proportional to the square roots of the densities of those gases.

Gram atom or gram atomic weight.—The mass in grams numerically equal to the atomic weight.

Gram equivalent of a substance is the weight of a substance displacing or otherwise reacting with 1.008 grams of hydrogen or combining with one-half of a gram atomic weight (8.00 grams) of oxygen.

Gram mole, gram formula weight, gram equivalent.—Mass in grams numerically equal to the molecular weight, formula weight or chemical equivalent, respectively.

Gram molecular weight or gram molecule.—A mass in grams of a substance numerically equal to its molecular weight. Gram mole.

Gravitation.—The universal attraction existing between all material bodies. The force of attraction between two masses *m* and *m'*, separated by a distance *r*, *k* being the constant of gravitation,

$$F = k \frac{mm'}{r^2}$$

(If *m* and *m'* are given in grams, and *r* in centimeters, *F* will be in dynes if $k = 6.670 \times 10^{-8}$.)

DEFINITIONS AND FORMULAE (Continued)

Hall effect.—When a steady current is flowing in a steady magnetic field, electromotive forces are developed which are at right angles both to the magnetic force and to the current and are proportional to the product of the intensity of the current, the magnetic force and the sine of the angle between the directions of these quantities.

Hardness.—Property of substances determined by their ability to abrade or indent one another. An arbitrary scale of hardness is based upon ten selected minerals. For metals the diameter of the indentation made by a hardened steel sphere (Brinnell) or the height of rebound of a small drop hammer (Shore Scleroscope) serve to measure hardness.

Harmonic motion.—See *Simple harmonic motion and Angular harmonic motion*.

Heat effect.—The heat in calories developed in a circuit by an electric current of I amperes flowing through a resistance of R ohms, with a difference of potential E volts for a time t seconds.

$$H = \frac{RI^2t}{4.18} = \frac{Eit}{4.18}$$

Heat equivalent, or latent heat, of fusion.—The quantity of heat necessary to change one gram of solid to a liquid with no temperature change. Dimensions,— $[l^2 t^{-2}]$.

Heat quantity is measured by the change of temperature produced. The cgs unit of heat is the **calorie**, the quantity of heat necessary to change the temperature of one gram of water from 3.5°C to 4.5°C (called a small calorie). If the temperature change involved is from 14.5 to 15.5°C , the unit is the normal calorie. The mean calorie is $\frac{1}{10}$ the quantity of heat necessary to raise one gram of water from 0°C to 100°C . The large calorie is equal to 1000 small calories. The British thermal unit is the heat required to raise the temperature of one pound of water at its maximum density, 1°F . It is equal to about 252 calories. Dimensions of energy,— $[m l^2 t^{-2}]$.

Heat of combustion of a substance is the amount of heat evolved by the combustion of 1 gram molecular weight of the substance.

Henry's law.—The mass of a slightly soluble gas that dissolves in a definite mass of a liquid at a given temperature is very nearly directly proportional to the partial pressure of that gas. This holds for gases which do not unite chemically with the solvent.

Hess' law of constant heat summation.—The amount of heat generated by a chemical reaction is the same whether reaction takes place in one step or in several steps, or all chemical reactions which start with the same original substances and end with the same final substances liberate the same amounts of heat, irrespective of the process by which the final state is reached.

DEFINITIONS AND FORMULAE (Continued)

Hooke's law.—Within the elastic limit of any body the ratio of the stress to the strain produced is constant.

Humidity, absolute.—Mass of water vapor present in unit volume of the atmosphere, usually measured as grams per cubic meter. It may also be expressed in terms of the actual pressure of the water vapor present.

Huygens' theory of light.—This theory states that light is a disturbance traveling through some medium, such as the ether. Thus light is due to wave motion in ether.

Every vibrating point on the wave-front is regarded as the center of a new disturbance. These secondary disturbances traveling with equal velocity, are enveloped by a surface identical in its properties with the surface from which the secondary disturbances start and this surface forms the new wave-front.

Hydrogen equivalent of a substance is the number of replaceable hydrogen atoms in 1 molecule or the number of atoms of hydrogen with which 1 molecule could react.

Hydrogen ion concentration or pH value is the logarithm of the reciprocal of the gram ionic hydrogen equivalents per liter; i.e., $\text{pH} = \log \frac{1}{(\text{H}^+)}$ per liter. Water has a concentration of H^+ ion of 10^{-7} and of OH^- ion of 10^{-7} moles per liter or a pH value of 7. Due to hydrolysis the composition of a weak acid solution titrated against a strong base is basic and of a weak base against a strong acid is acid. A truly neutral titrated solution of a strong acid or base has the same concentration of H^+ and OH^- ions as water.

Hydrolysis is a double decomposition reaction involving the splitting of water into its ions and the formation of a weak acid or base or both.

Hydrostatic pressure at a distance h from the surface of a liquid of density d ,

$$P = hdg.$$

The total force on an area A due to hydrostatic pressure,

$$F = PA = Ahdg.$$

Force in dynes and pressure in dynes per cm^2 will be given if h is in cm, d in g per cm^3 and g in cm per sec^2 .

Hysteresis.—The magnetization of a sample of iron or steel due to a magnetic field which is made to vary through a cycle of values, lags behind the field. This phenomenon is called hysteresis.

Steinmetz' equation for hysteresis gives the loss of energy in ergs per cycle per cm^3 ,

$$W = \eta B^{1.6}$$

where B is the maximum induction in maxwells per cm^2 and η the coefficient of hysteresis.

DEFINITIONS AND FORMULAE (Continued)

Illumination on any surface is measured by the luminous flux incident on unit area. The units in use are: the **lux**, one lumen per square meter; the **phot**, one lumen per square centimeter and the lumen per square foot. Since at unit distance from a point source of unit intensity the illumination is unity, unit illumination may be defined as that produced by a unit source at unit distance, hence the **meter-candle** or **candle-meter** which is equal to the lux and the **foot-candle** equivalent to one lumen per square foot.

Index of refraction for any substance is the ratio of the velocity of light in a vacuum to its velocity in the substance. It is also the ratio of the sine of the angle of incidence to the sine of the angle of refraction. In general, the index of refraction for any substance varies with the wave length of the refracted light.

Induced electromotive force in a circuit is proportional to the rate of change of magnetic flux through the circuit.

$$E = - \frac{d\phi}{dt}.$$

where $d\phi$ is the change of magnetic flux in a time dt . The induced current will be given by

$$I = \frac{d\phi}{Rdt}$$

where R is the resistance of the circuit.

Inertia.—The resistance offered by a body to a change of its state of rest or motion, a fundamental property of matter. Dimension,— $[m]$.

Indicators are substances which change from one color to another when the hydrogen ion concentration reaches a certain value, different for each indicator.

Inductance.—The change in magnetic field due to the variation of a current in a conducting circuit causes an induced counter electromotive force in the circuit itself. This phenomenon is known as **self-induction**. If an electromotive force is induced in a neighboring circuit the term mutual induction is used. Inductance may thus be distinguished as self- or mutual and is measured by the electromotive force produced in a conductor by unit rate of variation of the current. Units of inductance are the centimeter (absolute electromagnetic) and the henry, which is equal to 10^9 centimeters of inductance. The **henry** is that inductance in which an induced electromotive force of one volt is produced when the inducing current is changed at the rate of one ampere per second. Dimensions,— $[\epsilon^{-1} l^{-1} t^2]$; $[\mu l]$.

Induction.—Any change in the intensity or direction of a magnetic field causes an electromotive force in any conductor in the field. The induced electromotive force generates an induced current if the conductor forms a closed circuit.

DEFINITIONS AND FORMULAE (Continued)

Intensity of illumination in candle meters of a screen illuminated by a source of illuminating power P candles at a distance r meters, for normal incidence,

$$I = \frac{P}{r^2}$$

If two sources of illuminating power P_1 and P_2 produce equal illumination on a screen when at distances r_1 and r_2 respectively,

$$\frac{P_1}{r_1^2} = \frac{P_2}{r_2^2} \quad \text{or} \quad \frac{P_1}{P_2} = \frac{r_1^2}{r_2^2}$$

If I_o is the intensity of illumination when the screen is normal to the incident light, I the intensity when an angle θ

$$I = I_o \cos \theta$$

Intensity of magnetization is given by the quotient of the magnetic moment of a magnet by its volume. Unit intensity of magnetization is the intensity of a magnet which has unit magnetic moment per cubic centimeter. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-2}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

Intensity of radiation is the radiant energy emitted in a specified direction per unit time, per unit area of surface, per unit solid angle.

Intensity of sound depends upon the energy of the wave motion. The intensity is measured by the energy in ergs transmitted per second through one square centimeter of surface. The energy in ergs per cm^3 in a sound wave is given by

$$E = 2^2 \pi d n^2 a^2$$

where d is density in g per cm^3 , n is frequency in vib. per sec and a is amplitude in cm. The energy reaching the ear in unit time will also be proportional to the velocity of propagation.

Ion.—Acids, bases and salts (electrolytes) when dissolved in certain solvents are more or less dissociated into electrically charged units, or parts of the molecules, called ions.

Some electrolytes dissociate into ions when fused.

Ions carry charges of electricity, and in consequence have different properties from the uncharged radicals.

Positive ions are atoms or group of atoms which have lost valence electrons; negative ions are those to which additional electrons have been added.

Ionization potential.—The potential required to transfer an electron from its normal quantum level to infinity.

Isomerism.—Existence of molecules having the same number and kinds of atoms but in different configurations.

Isothermal.—When a gas passes through a series of pressure and volume variations without change of temperature the changes are called isothermal. A line on a pressure-volume diagram representing these changes is called an isothermal line.

Isotopes are elements occupying the same place in the periodic system, having the same nuclear charge, but differing

DEFINITIONS AND FORMULAE (Continued)

somewhat in atomic weight. Most of the ordinary inactive elements have been shown to consist of a mixture of isotopes.

Joule-Thomson effect.—The cooling which occurs when a highly compressed gas is allowed to expand in such a way that no external work is done is known as the Joule-Thomson effect. This cooling is inversely proportional to the square of the absolute temperature.

Kepler's laws.

I. The planets move about the sun in ellipses, at one focus of which the sun is situated.

II. The radius vector joining each planet with the sun describes equal areas in equal times.

III. The cubes of the mean distances of the planets from the sun are proportional to the squares of their times of revolution about the sun.

Kerr effect.—When plane polarized light is incident on the pole of an electromagnet, polished so as to act like a mirror, the plane of polarization of the reflected light is not the same when the magnet is "on" as when it is "off." It was found that the direction of rotation was opposite to that of the currents exciting the pole from which the light was reflected.

Kinetic theory, expression for pressure.

$$P = \frac{1}{3}Nmv^2$$

where N is the number of molecules in unit volume, m the mass of each molecule and v^2 the mean square of the velocity of the molecules.

Kinetic theory of gases.—1738.—Gases are considered to be made up of minute, perfectly elastic particles which are ceaselessly moving about with high velocities, colliding with each other and with the walls of the containing vessel. The pressure exerted by a gas is due to the combined effect of the impacts of the moving molecules upon the walls of the containing vessel, the magnitude of the pressure being dependent upon the kinetic energy of the molecules and their number.

Kirchhoff's laws.

I. The algebraic sum of the currents which meet at any point is zero.

II. In any closed circuit the algebraic sum of the products of the current and the resistance in each conductor in the circuit is equal to the electromotive force in the circuit.

Kirchhoff's laws of radiation.—The relation between the powers of emission and the powers of absorption for rays of the same wave-length is constant for all bodies at the same temperature. First, a substance when excited by some means or other possess a certain power of emission; it tends to emit definite rays, whose wave-lengths depend upon the nature of the substance and upon the temperature. Second, the substance exerts a definite absorptive power, which is a maximum for the rays it tends to emit. Third, at a given temperature the ratio between the emissive and the absorptive power

DEFINITIONS AND FORMULAE (Continued)

for a given wave-length is the same for all bodies, and is equal to the emissive power of a perfectly black body.

Kohlrausch's law.—When ionization is complete, the conductivity of an electrolyte is equal to the sum of the conductivities of the ions into which the substance dissociates.

Kundt's law.—On approaching an absorption band from the red side of the spectrum the refractive index is abnormally increased by the presence of the band, while the approach is from the blue side and the index is abnormally decreased.

Lambert's law of absorption.—Each layer of equal thickness absorbs an equal fraction of the light which traverses it.

Lambert's law of illumination.—The illumination of a surface on which the light falls normally from a point source is inversely proportional to the square of the distance of the surface from the source. If the normal to the surface makes an angle with the direction of the rays, the illumination is proportional to the cosine of that angle.

Latent heat of vaporization.—The quantity of heat necessary to change one gram of liquid to vapor without change of temperature, measured as calories per gram. Dimensions,— $[l^2 t^{-2}]$.

Lattice energy.—The energy required to separate the ions of a crystal to an infinite distance from each other.

LeChateller's principle.—If some stress is brought to bear upon a system in equilibrium, a change occurs, such that the equilibrium is displaced in a direction which tends to undo the effect of the stress.

Length, units of.—The centimeter, one of the three fundamental units of the cgs system, is one one-hundredth the length of the International Prototype Meter, at Paris, at zero degrees centigrade. The meter is 1,533,164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15°C. The standard in the British system is the yard, the prototype of which is kept by the British government. The United States standard yard is defined as $\frac{3600}{128}$ meter.

Lenses.—For a single thin lens whose surfaces have radii of curvature r_1 and r_2 whose principal focus is F , the index of refraction n , and conjugate focal distances f_1 and f_2 ,

$$\frac{1}{F} = \frac{1}{f_1} + \frac{1}{f_2} = (n - 1) \left(\frac{1}{r_1} + \frac{1}{r_2} \right)$$

For a thick lens, of thickness t ,

$$F = \frac{nr_1r_2}{(n - 1)[n(r_1 + r_2) - t(n - 1)]}$$

Combinations of lenses.—If f_1 and f_2 are the focal lengths of two thin lenses separated by a distance d the focal length of the system,

$$F = \frac{f_1 f_2}{f_1 + f_2 - d}$$

DEFINITIONS AND FORMULAE (Continued)

Lenz's law.—When an electromotive force is induced in a conductor by any change in the relation between the conductor and the magnetic field, the direction of the electromotive force is such as to produce a current whose magnetic field will oppose the change.

Line of force.—A term employed in the description of an electric or magnetic field. A line such that its direction at every point is the same as the direction of the force which would act on a small positive charge (or pole) placed at that point. A line of force is defined as starting from a positive charge (or pole) and ending on a negative charge (or pole).

The line (of force) is also used as a unit of magnetic flux, equivalent to the maxwell.

Lissajous figures.—The path described by a particle which is simultaneously displaced by two simple harmonic motions at right angles, when the periods of the two motions are in the ratio of two small whole numbers, shows a variety of characteristic curves called Lissajous figures.

Liquid.—A state of matter in which the molecules are relatively free to change their positions with respect to each other but restricted by cohesive forces so as to maintain a relatively fixed volume.

Loschmidt's number.—The number of molecules per unit volume of an ideal gas at 0°C and normal atmospheric pressure.

$$n_0 = 2.687 \times 10^{19} \text{ per cm}^3.$$

Luminous flux.—The total visible energy emitted by a source per unit time is called the total luminous flux from the source. The unit of flux, the **lumen**, is the flux emitted in unit solid angle (steradian) by a point source of one candle luminous intensity. A uniform point source of one candle intensity thus emits 4π lumens.

Luminous intensity or candle-power is the property of a source of emitting luminous flux and may be measured by the luminous flux emitted per unit solid angle. The accepted unit of luminous intensity is the **international candle**. The **hefner unit**, which is equivalent to 0.9 international candles, is the intensity of a lamp of specified design burning amyl acetate, called the Hefner lamp.

The mean horizontal candle-power is the average intensity measured in a horizontal plane passing through the source. The mean spherical candle-power is the average candle-power measured in all directions and is equal to the total luminous flux in lumens divided by 4π .

Magnetic field due to a current.—The intensity of the magnetic field in oersted at the center of a circular conductor of radius r in which a current I in absolute electromagnetic units is flowing,

$$H = \frac{2\pi I}{r}$$

DEFINITIONS AND FORMULAE (Continued)

If the circular coil has n turns the magnetic intensity at the center is,

$$H = \frac{2\pi nI}{r}$$

The magnetic field in a long solenoid of n turns per centimeter carrying a current I in absolute electromagnetic units

$$H = 4\pi nI$$

If I is given in amperes the above formulae become,—

$$H = \frac{2\pi I}{10r}, \quad H = \frac{2\pi nI}{10r}, \quad H = \frac{4\pi nI}{10}$$

Magnetic field due to a magnet.—At a point on the magnetic axis prolonged, at a distance r cm from the center of the magnet of length $2l$ whose poles are $+m$ and $-m$ and magnetic moment M , the field strength in oersted is,

$$H = \frac{4mlr}{(r^2 - l^2)^2}$$

If r is large compared with l ,

$$H = \frac{2M}{r^3}$$

At a point on a line bisecting the magnet at right angles, with corresponding symbols,

$$H = \frac{2ml}{(r^2 + l^2)^{\frac{3}{2}}}$$

For large value of r ,

$$H = \frac{M}{r^3}$$

Magnetic field intensity or magnetizing force.—Is measured by the force acting on unit pole. Unit field intensity, the oersted, is that field which exerts a force of one dyne on unit magnetic pole. The field intensity is also specified by the number of lines of force intersecting unit area normal to the field, equal numerically to the field strength in oersted. Magnetizing force is measured by the space rate of variation of magnetic potential and as such its unit may be the **gilbert per centimeter**. The gamma (γ) is equivalent to 0.00001 oersted. Dimensions,— $[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

Magnetic flux through any area perpendicular to a magnetic field is measured as the product of the area by the field strength. The units of magnetic flux, the **maxwell** is the flux through a square centimeter normal to a field of one gauss. The line is also a unit of flux. It is equivalent to the maxwell. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$.

Magnetic induction resulting when any substance is subjected to a magnetic field is measured as the magnetic flux per unit area taken perpendicular to the direction of the

DEFINITIONS AND FORMULAE (Continued)

flux. The unit is the maxwell per square centimeter or its equivalent, the gauss. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$.

If a substance of permeability μ is placed in a magnetic field H the magnetic induction in the substance,

$$B = \mu H.$$

If I is the magnetic moment for unit volume, or intensity of magnetization,

$$B = H + 4\pi I.$$

The susceptibility,

$$\kappa = \frac{I}{H}, \quad \mu = 1 + 4\pi\kappa.$$

Magnetic moment of a magnet is measured by the torque experienced when it is at right angles to a uniform field of unit intensity. The value of the magnetic moment is given by the product of the magnetic pole strength by the distance between the poles. Unit magnetic moment is that possessed by a magnet formed by two poles of opposite sign and of unit strength, one centimeter apart. Dimensions,— $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$; $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]$.

If the poles are separated by a distance which is great compared with the dimensions of the magnet, the magnetic moment of a magnet of length l whose poles have values of $+m$ and $-m$ is,

$$M = ml.$$

Magnetic permeability is a property of materials modifying the action of magnetic poles placed therein and modifying the magnetic induction resulting when the material is subjected to a magnetic field or magnetizing force. The permeability of a substance may be defined as the ratio of the magnetic induction in the substance to the magnetizing field to which it is subjected. The permeability of a vacuum is unity. Dimensions,— $[\epsilon^{-1} l^{-2} t^2]$; $[\mu]$.

Magnetic pole or quantity of magnetism.—Two unit quantities of magnetism concentrated at points unit distance apart in a vacuum repel each other with unit force. If the distance involved is one centimeter and the force one dyne, the quantity of magnetism at each point is one cgs unit of magnetism. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$.

Magnetic potential or magnetomotive force at a point is measured by the work required to bring unit positive pole from an infinite distance (zero potential) to the point. The unit is the *gilbert*, that magnetic potential against which an erg of work is done when unit magnetic pole is transferred. Dimensions,— $[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$; $[\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$.

Magnifying power of an optical instrument is the ratio of the angle subtended by the image of the object seen through the instrument to the angle subtended by the object when seen by the unaided eye. In the case of the microscope or simple magnifier the object as viewed by the unaided eye is supposed to be a distance of 25 cm (10 in.).

DEFINITIONS AND FORMULAE (Continued)

Mass.—Quantity of matter. **Units of mass**—the gram is $\frac{1}{1000}$ the quantity of matter in the International Prototype Kilogram; one of the three fundamental units of the cgs system. The British standard of mass is the pound, of which a standard is preserved by the government. The United States standard mass is the avoirdupois pound defined as $\frac{1}{2.20462}$ kilogram.

Mass action, law of.—At a constant temperature the product of the active masses on one side of a chemical equation when divided by the product of the active masses on the other side of the chemical equation is a constant, regardless of the amounts of each substance present at the beginning of the action.

Mass by weighing on a balance with unequal arms.—If W_1 is the value for one side, W_2 the value for the other, the true mass,

$$W = \sqrt{W_1 W_2}.$$

Maxwell's rule.—A law stating that every part of an electric circuit is acted upon by a force tending to move it in such a direction as to enclose the maximum amount of magnetic flux.

Mechanical equivalent of heat is the quantity of energy which, when transformed into heat, is equivalent to unit quantity of heat; 4.18×10^7 ergs = 1 calorie (20°C).

Metallic elements in general are distinguished from the non-metallic elements by their lustre, malleability, conductivity and usual ability to form positive ions. **Non-metallic elements** are not malleable, have low conductivity and never form positive ions.

Minimum deviation.—The deviation or change of direction of light passing through a prism is a minimum when the angle of incidence is equal to the angle of emergence. If D is the angle of minimum deviation and A the angle of the prism, the index of refraction of the prism for the wave length used is,

$$n = \frac{\sin \frac{1}{2}(A + D)}{\sin \frac{1}{2}A}$$

Mixtures consist of two or more substances intermingled with no constant percentage composition, and with each component retaining its essential original properties.

Modulus of elasticity.—The stress required to produce unit strain, which may be a change of length (Young's modulus): a twist or shear (modulus of rigidity or modulus of torsion) or a change of volume (bulk modulus), expressed in dynes per square centimeter. Dimensions,—the same as of stress, [$m\ l^{-1} t^{-2}$].

A **molar solution** contains one mole per 1000 grams of solvent.

A **molar solution** contains one mole or gram molecular weight of the solute in one liter of solution.

DEFINITIONS AND FORMULAE (Continued)

Mole.—A mass numerically equal to the molecular weight.

Molecule.—The smallest unit quantity of matter which can exist by itself and retain all the properties of the original substance.

Molecular volume.—Volume occupied by one mole. Numerically equal to the molecular weight divided by the density.

Molecular weight.—The sum of the atomic weights of all the atoms in a molecule.

Mol volume.—The volume occupied by a mol or a gram molecular weight of any gas measured at standard conditions is 22.414 liters.

Moment of force or torque.—The effectiveness of a force to produce rotation about an axis, measured by the product of the force and the perpendicular distance from the line of action of the force to the axis. Cgs unit—the dyne-centimeter. Dimensions,— $[m l^2 t^{-2}]$. If a force F acts to produce rotation about a center at a distance d from the line in which the force acts, the force has a torque,

$$L = Fd.$$

Moment of inertia.—A measure of the effectiveness of mass in rotation. In the rotation of a rigid body not only the body's mass, but the distribution of the mass about the axis of rotation determines the change in the angular velocity resulting from the action of a given torque for a given time. Moment of inertia in rotation is analogous to mass (inertia) in simple translation. The cgs unit is g-cm^2 . Dimensions,— $[m l^2]$.

If m_1, m_2, m_3 , etc. represent the masses of infinitely small particles of a body; r_1, r_2, r_3 , etc. their respective distances from an axis of rotation, the moment of inertia about this axis will be

$$I = (m_1 r_1^2 + m_2 r_2^2 + m_3 r_3^2 + \dots)$$

or
$$I = \Sigma(mr^2)$$

Momentum.—Quantity of motion measured by the product of mass and velocity. Cgs unit—, one gram-centimeter per second. Dimensions,— $[m l t^{-1}]$.

A mass m moving with velocity v has a momentum,

$$M = mv.$$

If a mass m has its velocity changed from v_1 to v_2 by the action of a force F for a time t ,

$$mv_2 - mv_1 = Ft.$$

Monochromatic emissive power is the ratio of the energy of certain defined wave lengths radiated at definite temperatures to the energy of the same wave lengths radiated by a black body at the same temperature and under the same conditions.

DEFINITIONS AND FORMULAE (Continued)

Monotropic.—Crystal forms one of which is always metastable with respect to the other.

Mosley's law.—The frequencies of the characteristic X-rays of the elements show a strict linear relationship with the square of the atomic number.

Motion, laws of.—See *Newton's law of motion*.

Multiple proportions, law of.—If two elements form more than one compound, the weights of the first element which combine with a fixed weight of the second element are in the ratio of integers to each other.

Nernst effect.—When heat flows across the lines of magnetic force, there is observed an electromotive force in the mutually perpendicular direction.

Neutralization is a reaction in which the hydrogen ion of an acid and the hydroxyl ion of a base unite to form water, the other product being a salt.

Neutron.—An elementary particle with approximately the mass of a hydrogen atom but without any electric charge. The neutron is one of the constituents of the atomic nucleus.

Newton's law of cooling.—The rate of cooling of a body under given conditions is proportional to the temperature difference between the body and its surroundings.

Newton's law of motion.

I. Every body continues in its state of rest or of uniform motion in a straight line except in so far as it may be compelled to change that state by the action of some outside force.

II. Change of motion is proportional to force applied and takes place in the direction of the line of action of the force.

III. To every action there is always an equal and opposite reaction.

Nodal points.—Two points on the axis of a lens such that a ray entering the lens in the direction of one, leaves as if from the other and parallel to the original direction.

A **normal salt** is an ionic compound containing neither replaceable hydrogen nor hydroxyl ions.

A **normal solution** contains one gram molecular weight of the dissolved substance divided by the hydrogen equivalent of the substance (that is, one gram equivalent) per liter of solution.

Nucleus.—The heavy central part of an atom in which most of the mass and the total positive electric charge is concentrated. The charge of the nucleus, an integral multiple (Z) of the electronic charge, is the essential factor which distinguishes one element from another. Z is called the atomic number.

Numerical aperture is the sine of half the angular aperture, used as a measure of the optical power of an objective.

Ohm's law.—Current in terms of electromotive force E and resistance R .

DEFINITIONS AND FORMULAE (Continued)

$$I = \frac{E}{R}.$$

The current is given in amperes when E is in volts and R in ohms.

Organ pipes.—The frequency of vibration of a closed pipe or other air column of length l , where V is the velocity of sound in air, for the fundamental and first three overtones respectively is,

$$n_0 = \frac{V}{4l}, \quad n_1 = \frac{3V}{4l}, \quad n_2 = \frac{5V}{4l}, \quad n_3 = \frac{7V}{4l}$$

For an open pipe,

$$n_0 = \frac{V}{2l}, \quad n_1 = \frac{2V}{2l}, \quad n_2 = \frac{3V}{2l}, \quad n_3 = \frac{4V}{2l}$$

Oxidation is any process which increases the proportion of oxygen or acid-forming element or radical in a compound.

Paramagnetic bodies are those which tend to set the longest dimension parallel to the magnetic field. The permeability of a paramagnetic substance is greater than unity.

Pascal's law.—Pressure exerted at any point upon a confined liquid is transmitted undiminished in all directions.

Peltier effect.—When a current flows across the junction of two unlike metals it gives rise to an absorption or liberation of heat. If the current flows in the same direction as the current at the hot junction in a thermoelectric circuit of the two metals, heat is absorbed; if it flows in the same direction as the current at the cold junction of the thermoelectric circuit heat is liberated.

Pendulum.—For a simple pendulum of length l , for a small amplitude, the complete period,

$$T = 2\pi \sqrt{\frac{l}{g}} \quad \text{or} \quad g = 4\pi^2 \frac{l}{T^2}$$

T will be given in seconds if l is in cm and g in cm per sec².

For a sphere suspended by a wire of negligible mass where d is the distance from the knife edge to the center of the sphere whose radius is r , the length of the equivalent simple pendulum,

$$l = d + \frac{2r^2}{5d}$$

If the period is P for an arc θ , the time of vibration in an infinitely small arc is approximately

$$T = \frac{P}{1 + \frac{1}{4} \sin^2 \frac{\theta}{4}}$$

For a compound pendulum, if a body of mass m be suspended from a point about which its moment of inertia is I with its center of gravity a distance h below the point of suspension, the period

DEFINITIONS AND FORMULAE (Continued)

$$T = 2\pi \sqrt{\frac{I}{mgh}}$$

Period in uniform circular motion is the time of one complete revolution. In any oscillatory motion it is the time of a complete oscillation. Dimension,—[t]

Period of vibration of a magnet of magnetic moment M and moment of inertia I vibrating in a field of strength H ,

$$T = 2\pi \sqrt{\frac{I}{MH}}$$

Periodic law.—Elements when arranged in the order of their atomic weights or atomic numbers show regular variations in most of their physical and chemical properties.

Permeance, the reciprocal of reluctance. Unit permeance is the permeance of a cylinder one square centimeter cross-section and one centimeter length taken in a vacuum. Dimensions,—[$\epsilon^{-1} l^{-1} t^2$]; [μl].

Phase of oscillatory motion.—The fraction of a whole period which has elapsed since the moving particle last passed through its middle position in a positive direction.

Photographic density.—The density D of silver deposit on a photographic plate or film is defined by the relation

$$D = \log O$$

where O is the opacity. If I_o and I are the incident and transmitted intensities respectively the opacity is given by I_o/I . The transparency is the reciprocal of the opacity or I/I_o .

Piezo-electric effect.—The phenomenon exhibited by certain crystals of expansion along one axis and contraction along another when subjected to an electric field. The converse effect, whereby mechanical strains produce opposite charges on different faces of the crystal, also obtains.

Pinch effect.—When an electric current, either direct or alternating, passes through a liquid conductor, that conductor tends to contract in cross-section, due to *electromagnetic* forces.

Pitch of sound is determined by the frequency or number of vibrations per second.

Planck's constant (h) when multiplied by the frequency of radiation ν , gives the quantity of energy ($= h\nu$) contained in one quantum.

Poisson's ratio is the ratio of the transverse contraction per unit dimension of a bar of uniform cross-section to its elongation per unit length, when subjected to a tensile stress.

Polarized light.—Light which exhibits different properties in different directions at right angles to the line of propagation is said to be polarized. Specific rotation is the power of liquids to rotate the plane of polarization. It is stated in terms of specific rotation or the rotation in degrees per decimeter per unit density.

DEFINITIONS AND FORMULAE (Continued)

Polymorphism.—The ability to exist in two or more crystalline forms.

Positron.—A particle with a mass equal to that of the electron but possessing a positive charge.

Potential (electric) at any point is measured by the work necessary to bring unit positive charge from an infinite distance. Difference of potential between two points is measured by the work necessary to carry unit positive charge from one to the other. If the work involved is one erg we have the electrostatic unit of potential. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]$.

The potential at a point due to a charge q at a distance r in a medium whose dielectric constant is ϵ is,

$$V = \frac{q}{\epsilon r}$$

Power.—The time rate at which work is done. Units of power,—the watt, one joule (ten million ergs) per second; the kilowatt is equal to 1000 watts; the horse-power, 33,000 foot-pounds per minute, is equal to 746 watts. Dimensions,— $[m l^2 t^{-3}]$.

If an amount of work W is done in time t the power or rate of doing work is

$$P = \frac{W}{t}$$

Power will be obtained in watts if W is expressed in joules (10^7 ergs) and t in sec.

Power in watts for alternating current,

$$P = EI \cos \phi$$

where E and I are the effective values of the electromotive force and current in volts and amperes respectively and ϕ the phase angle between the current and the impressed electromotive force.

The ratio,

$$\frac{P}{EI} = \cos \phi$$

is called the power factor.

Power developed by a direct current.—The power in watts developed by an electric current flowing in a conductor, where E is the difference of potential at its terminals in volts, R its resistance in ohms, and I the current in amperes,

$$P = EI = RI^2$$

The work done in joules in a time t sec is,

$$W = EIt = RI^2t.$$

Power ratios in telephone engineering are measured in **decibels**. The gain or loss of power expressed in decibels is ten times the logarithm of the power ratio. By reference to an arbitrarily chosen "power level" the actual power may be expressed in decibels. The numerical values thus used will

DEFINITIONS AND FORMULAE (Continued)

not be proportional to the actual power level but roughly to the sensation on the ear produced when the electrical power is converted into sound. A difference of 1 decibel in the power supply to a telephone receiver produces approximately the smallest change in volume of sound which a normal ear can detect.

Pressure.—Force applied to, or distributed, over a surface; measured as force per unit area. Cgs unit,—the barye, one dyne per square centimeter. The megabarye is equal to 10^6 dynes per square centimeter. Pressure is also measured by the height of the column of mercury or water which it supports. Dimensions,— $[m\ l^{-1}\ t^{-2}]$.

The pressure due to a force F distributed over an area A ,

$$P = \frac{F}{A}$$

Absolute pressure.—Pressure measured with respect to zero pressure. *Gauge pressure*—pressure measured with respect to that of the atmosphere.

Principal focus of a lens or spherical mirror is the point of convergence of light coming from a source at an infinite distance.

Projectiles.—For bodies projected with velocity v at an angle a above the horizontal, the time to highest point of flight,

$$t = \frac{v \sin a}{g}$$

Total time of flight to reach the original horizontal plane,

$$T = \frac{2v \sin a}{g}$$

Maximum height,

$$h = \frac{v^2 \sin^2 a}{2g}$$

Horizontal range,

$$R = \frac{v^2 \sin 2a}{g}$$

In the above equations the resistance of the air is neglected g is the acceleration due to gravity.

Proton.—An elementary particle having a positive charge equivalent to the negative charge of the electron but possessing a mass approximately 1845 times as great. The proton is in effect the positive nucleus of the hydrogen atom.

Purkinje effect.—A phenomenon associated with the human eye, making it more sensitive to blue light when the illumination is poor (less than about 0.1 lumen per sq. ft.) and to yellow light when the illumination is good.

Quality or timbre of a sound depends on the coexistence with the fundamental of other vibrations of various frequencies and amplitudes.

DEFINITIONS AND FORMULAE (Continued)

Quantity of electricity or charge.—The electrostatic unit of charge, the quantity which when concentrated at a point and placed at unit distance from an equal and similarly concentrated quantity, is repelled with unit force. If the distance is one centimeter and force of repulsion one dyne and the surrounding medium a vacuum, we have the electrostatic unit of quantity. The electrostatic unit of quantity may be defined as that transferred by electrostatic unit current in unit time. The quantity transferred by one ampere in one second is the coulomb, the practical unit. The faraday is the electrical charge carried by one gram equivalent. The coulomb = 3×10^9 electrostatic units. Dimensions,—

$$[e^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]; [\mu^{-2} m^{\frac{1}{2}} l^{\frac{1}{2}}]$$

Radiation.—If I_0 is the intensity of normal radiation and I the intensity at an angle

$$I = I_0 \cos \theta$$

This is called Lambert's law. It does not apply in all cases.

Radiation formula, Planck's.—The emissive power of a black body at wave length λ may be written

$$E_\lambda = \frac{c_1 \lambda^{-5}}{e^{c_2/\lambda T} - 1}$$

where c_1 and c_2 are constants with numerical values 3.7403×10^8 microwatts per cm^2 per 0.01μ zone of spectrum and 14384 micron degrees, respectively and T the absolute temperature.

Radioactive substances continuously undergo a process of atomic disintegration in which energy is liberated. One or more radiations known as α -rays, β -rays or γ -rays are spontaneously emitted.

Radius of curvature from spherometer readings.—If l is the mean length of the sides of the triangle formed by the points of the three legs, d the spherometer readings, the radius of curvature of the surface is

$$R = \frac{l^2}{6d} + \frac{d}{2}$$

Radius of gyration may be defined as the distance from the axis of rotation at which the total mass of a body might be concentrated without changing its moment of inertia. The product of total mass and the square of the radius of gyration will give (the) moment of inertia.

Rankine scale of temperature.—The absolute Fahrenheit scale.

Raoult's law.—Molar weights of non-volatile non-electrolytes when dissolved in a definite weight of a given solvent under the same conditions lower the solvent's freezing point, elevate its boiling point and reduce its vapor pressure equally for all such solutes

DEFINITIONS AND FORMULAE (Continued)

Reduction is any process which increases the proportion of hydrogen or base-forming elements or radicals in a compound.

Reflection coefficient or reflectivity is the ratio of the light reflected from a surface to the total incident light. The coefficient may refer to diffuse or to specular reflection. In general it varies with the angle of incidence and with the wavelength of the light.

Reflection of light by a transparent medium in air. (Fresnel's formulæ).—If i is the angle of incidence, r the angle of refraction, n_1 the index of refraction for air (nearly equal to unity), n_2 index of refraction for a medium, then the ratio of the reflected light to the incident light is,

$$R = \frac{1}{2} \left(\frac{\sin^2 (i - r)}{\sin^2 (i + r)} + \frac{\tan^2 (i - r)}{\tan^2 (i + r)} \right)$$

If $i = 0$ (normal incidence), and $n_1 = 1$ (approximate for air),

$$R = \left(\frac{n_2 - 1}{n_2 + 1} \right)^2$$

Refraction.—See *Index of refraction*; *Snell's law*.

Refraction at a spherical surface.—If u be the distance of a point source, v the distance of the point image or the intersection of the refracted ray with the axis, n_1 and n_2 the indices of refraction of the first and second medium, and r the radius of curvature of the separating surface,

$$\frac{n_2}{v} + \frac{n_1}{u} = \frac{n_2 - n_1}{r}$$

If the first medium is air the equation becomes,

$$\frac{n}{v} + \frac{1}{u} = \frac{n - 1}{r}$$

Refractivity is given by $(n - 1)$ when n is the index of refraction; the **specific refractivity** is given by $\frac{n - 1}{d}$ where d is the density. **Molecular refractivity** is the product of specific refractivity by the molecular weight.

Relative humidity.—The ratio of the quantity of water vapor present in the atmosphere to the quantity which would saturate at the existing temperature. It is also the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature.

Reluctance is that property of a magnetic circuit which determines the total magnetic flux in the circuit when a given magnetomotive force is applied. Unit, the reluctance of one centimeter length and one square centimeter cross-section of space taken in a vacuum. Dimensions,— $[el \ t^{-2}]$; $[\mu^{-1} \ l^{-1}]$.

Reluctivity or specific reluctance is the reciprocal of magnetic permeability. The reluctivity of empty space is taken as unity. Dimensions,— $[el^2 \ t^{-2}]$; $[\mu^{-1}]$.

DEFINITIONS AND FORMULAE (Continued)

Replacement series.—The arrangement of the metals in order of the values of their oxidation potentials.

Resistance is a property of conductors depending on their dimensions, material and temperature which determines the current produced by a given difference of potential. The practical unit of resistance, the **ohm** is that resistance through which a difference of potential of one volt will produce a current of one ampere. The **international ohm** is the resistance offered to an unvarying current by a column of mercury at 0°C, 14.4521 grams in mass, of constant cross-sectional area and 106.300 centimeters in length, sometimes called the legal ohm. Dimensions,— $[\epsilon^{-1} l^{-1} t]$; $[\mu l t^{-1}]$.

Resistance of a conductor at 0°C, of length l , cross-section s and specific resistance ρ

$$R_o = \rho \frac{l}{s}$$

The resistivity may be expressed as ohm-cm when R is in ohms, l in cm and s in cm^2 .

Resistance of a conductor at a temperature t whose resistance at 0°C is R_o and whose temperature resistance coefficient is α .

$$R_t = R_o(1 + \alpha t)$$

Resistance of conductors in series and parallel.—The total resistance of any number of resistances joined in series is the sum of the separate resistances. The total resistance of conductors in parallel whose separate resistances are $r_1, r_2, r_3 \dots r_n$ is given by the formula

$$\frac{1}{R} = \frac{1}{r_1} + \frac{1}{r_2} + \frac{1}{r_3} \dots + \frac{1}{r_n}$$

Where R is the total resistance. For two terms this becomes.

$$R = \frac{r_1 r_2}{r_1 + r_2}$$

Resistivity or specific resistance, the reciprocal of conductivity, is measured by the resistance of a body of the substance of unit cross-section and of unit length at 0°C also called volume resistivity. The unit may be indicated as the ohm-centimeter. Dimensions,— $[\epsilon^{-1} l]$, $[\mu l^2 t^{-1}]$.

Mass resistivity is the longitudinal resistance per unit length of a uniform bar of the substance of such a sectional area that it contains one unit of mass per unit of length. Dimensions,— $[\epsilon^{-1} m l^{-3} t]$; $[\mu m l^{-1} t^{-1}]$.

Surface resistivity is the resistance of unit length and unit width of a surface.

Resolving power of a telescope or microscope is indicated by the minimum separation of two objects for which they appear distinct and separate when viewed through the instrument.

DEFINITIONS AND FORMULAE (Continued)

Restitution, coefficient of, for two bodies on impact.—The ratio of the difference in velocity, after impact to the difference before impact.

Reversible reactions are those in which the products of the reaction may in turn react upon each other to form the original reacting substances.

Rotatory power is the power of rotating the plane of polarized light, given in general by θ/l where θ is the total rotation which occurs in a distance l .

The **molecular** or **atomic rotatory power** is the product of the specific rotatory power by the molecular or atomic weight. Magnetic rotatory power is given by

$$\theta/e H \cos \alpha$$

where H the intensity of the magnetic field, and α the angle between the field and the direction of the light.

Rydberg formula.—A formula, similar to that of Balmer, for expressing the wave-numbers (ν) of the lines in a spectral series:

$$\nu = R \left[\frac{1}{(n+a)^2} - \frac{1}{(m+b)^2} \right]$$

where n and m are integers and $m > n$, a and b are constants for a particular series, and R is the *Rydberg constant*, 109677.8 cm^{-1} for hydrogen.

Salt.—Any substance which yields ions, other than hydrogen or hydroxyl ions. A salt is obtained by displacing the hydrogen of an acid by a metal.

Seebeck effect.—If a circuit consists of two metals, one junction hotter than the other, a current flows in the circuit. The direction of the flow depends on the metals and the temperature of the junctions.

Sensitiveness of a balance.—Assuming the three knife edges of a balance to lie on a straight line,—if M is the weight of the beam, h the distance of the center of gravity below the knife edge, L the length of the balance arms and m a small mass added to one pan, the deflection θ produced is given by

$$\tan \theta = \frac{mL}{Mh}.$$

Simple harmonic motion.—Periodic oscillatory motion in a straight line in which the restoring force is proportional to the displacement. If a point move uniformly in a circle, the motion of its projection on the diameter (or any straight line in the same plane) is simple harmonic motion.

If r is the radius of the reference circle, ω the angular velocity of the point in the circle, θ the angular displacement at the time t after the particle passes the mid-point of its path, the linear displacement,

$$x = r \sin \theta = r \sin \omega t.$$

DEFINITIONS AND FORMULAE (Continued)

The velocity at the same instant,

$$v = r\omega \cos \theta = \omega \sqrt{r^2 - x^2}$$

The acceleration,

$$a = -\omega^2 x.$$

The force for a mass m ,

$$F = m\omega^2 x = -\frac{4\pi^2 mx}{T^2}$$

The period,

$$T = 2\pi \sqrt{\frac{x}{a}}$$

In the above equations the cgs system calls for x and r in cm, v in cm per sec, a in cm per sec², T in sec, m in grams, F in dynes, θ in radians and ω in radians per sec.

Simple machine.—A contrivance for the transfer of energy and for increased convenience in the performance of work.

Mechanical advantage is the ratio of the resistance overcome to the force applied. Velocity ratio is the ratio of the distance through which force is applied to the distance through which resistance is overcome.

Efficiency is the ratio of the work done by a machine to the work done upon it.

If a force f applied to a machine through a distance S results in a force F exerted by the machine through a distance s , neglecting friction,

$$fS = Fs.$$

The theoretical mechanical advantage or velocity ratio in the above case is,

$$\frac{S}{s}.$$

Actually the force obtained from the machine will have a smaller value than will satisfy the equation above. If F' be the actual force obtained, the practical mechanical advantage

will be,

$$\frac{F'}{f}.$$

The efficiency of the machine,

$$E = \frac{F's}{fS}.$$

Snell's law of refraction.—If i is the angle of incidence, r the angle of refraction, v the velocity of light in the first medium, v' the velocity in the second medium, the index of refraction n ,

$$n = \frac{\sin i}{\sin r} = \frac{v}{v'}.$$

Solid.—A state of matter in which the relative motion of the molecules is restricted and they tend to retain a definite fixed position relative to each other, giving rise to crystal

DEFINITIONS AND FORMULAE (Continued)

structure A solid may be said to have a definite shape and volume.

Solid angle.—Measured by the ratio of the surface of the portion of a sphere enclosed by the conical surface forming the angle, to the square of the radius of the sphere. Unit of solid angle,—the steradian, the solid angle which encloses a surface on the sphere equivalent to the square of the radius. Dimensions,—unity.

Solubility of one liquid or solid in another is the mass of a substance contained in a solution which is in equilibrium with an excess of the substance. Under these conditions the solution is said to be saturated. Solubility of a gas is the ratio of concentration of gas in the solution to the concentration of gas above the solution.

Solute.—That constituent of a solution which is considered to be dissolved in the other, the solvent. The solvent is usually present in larger amount than the solute.

A **solution** is **saturated** if it contains at given temperature as much of a solute as it can retain in the presence of an excess of that solute

A **true solution** is a mixture, liquid, solid or gaseous, in which the components are uniformly distributed throughout the mixture. The proportion of the constituents may be varied within certain limits.

Solubility product or precipitation value is the product of the concentrations of the ions of a substance in a saturated solution of the substance.

Solvent.—That constituent of a solution which is present in larger amount; or, the constituent which is liquid in the pure state, in the case of solutions of solids or gases in liquids.

Specific gravity.—The ratio of the mass of a body to the mass of an equal volume of water at 4°C or other specified temperature. Dimensions,—unity.

Specific heat of a substance is the ratio of its thermal capacity to that of water at 15°C. Dimensions,—unity.

If a quantity of heat H calories is necessary to raise the temperature of m grams of a substance from t_1 to t_2 °C, the specific heat, or more properly, thermal capacity of the substance,

$$s = \frac{H}{m(t_1 - t_2)}.$$

Specific heat by the method of mixtures.—Where a mass m_1 of the substance is heated to a temperature t_1 , then placed in a mass of water m_2 at a temperature t_2 contained in a calorimeter with stirrer (of same material) of mass m_3 , specific heat of the calorimeter c , t_3 the final temperature

$$m_1 s(t_1 - t_3) = (m_3 c + m_2)(t_3 - t_2).$$

DEFINITIONS AND FORMULAE (Continued)

Black's ice calorimeter.—If a body of mass m and temperature t melts a mass m' of ice, its temperature being reduced to 0°C , the specific heat of the substance is,

$$s = \frac{80 \, 1 m'}{m t}$$

Bunsen's ice calorimeter.—A body of mass m at temperature t causes a motion of the mercury column of l centimeters in a tube whose volume per unit length is v . The specific heat is

$$s = \frac{884 l v}{m t}$$

Specific inductive capacity.—The ratio of the capacitance of a condenser with a given substance as dielectric to the capacitance of the same condenser with air or a vacuum as dielectric is called the specific inductive capacity. The ratio of the dielectric constant of a substance to that of a vacuum.

Specific rotation.—If there are n grams of active substance in v cubic centimeters of solution and the light passes through l centimeters, r being the observed rotation in degrees, the specific rotation (for 1 centimeter),

$$[\alpha] = \frac{r v}{n l}$$

Specific volume is the reciprocal of density. Dimensions,— $[m^{-1} l^3]$.

Spectral series are spectral lines or groups of lines which occur in an orderly sequence.

Speed.—Time rate of motion measured by the distance moved over in unit time. Cgs unit,—one centimeter per second. Dimension,— $[l t^{-1}]$.

Spherical aberration.—When large surfaces of spherical mirrors or lenses are used the light divergent from a point source is not exactly focused at a point. The phenomenon is known as spherical aberration. For axial pencils the error is known as axial spherical aberration, for oblique pencils, coma.

Spherical mirrors.—If R is the radius of curvature, F principal focus, and f_1 and f_2 any two conjugate focal distances,

$$\frac{1}{f_1} + \frac{1}{f_2} = \frac{1}{F} = \frac{2}{R}$$

If the linear dimensions of the object and image be O and I respectively and u and v their distances from the mirror,

$$\frac{O}{I} = \frac{u}{v}$$

Standard conditions for gases.—Measured volumes of gases are quite generally recalculated to 0°C temperature and 760 mm pressure, which have been arbitrarily chosen as standard conditions.

DEFINITIONS AND FORMULAE (Continued)

Stark effect.—A change occurs in the number of spectral lines when the emission takes place in a strong electrical field. The phenomena are different for different lines and the observed effects depend upon the geometrical relation between the direction of emission and the direction of the electric field.

Stationary or standing waves are produced in a medium by the simultaneous transmission, in opposite directions of two similar wave motions. Fixed points of minimum amplitude are called **nodes**. A **segment** extends from one node to the next. An **antinode** or **loop** is the point of maximum amplitude between two nodes.

Stefan-Boltzman law of radiation.—The energy radiated in unit time by a black body is given by, $E = K(T^4 - T_o^4)$, where T is the absolute temperature of the body, T_o the absolute temperature of the surroundings, and K a constant.

Stoichiometric.—Pertaining to weight relations in chemical reactions.

Stoke's law gives the rate of fall of a small sphere in a viscous fluid. When a small sphere falls under the action of gravity through a viscous medium it ultimately acquires a constant velocity,

$$V = \frac{2ga^2(d_1 - d_2)}{9\eta}$$

where a is the radius of the sphere, d_1 and d_2 the densities of the sphere and the medium respectively, and η the coefficient of viscosity. V will be in cm per sec if g is in cm per sec², a in cm, d_1 and d_2 in g per cm³ and η in dyne-sec per cm² or poises.

Strain.—The deformation resulting from a stress measured by the ratio of the change to the total value of the dimension in which the change occurred. Dimensions,—unity.

Stress.—The force producing or tending to produce deformation in a body measured by the force applied per unit area (gs units,—one dyne per square centimeter. Dimensions,— $[m\ t^{-1}\ t^{-2}]$.

Surface density of electricity.—Quantity of electricity per unit area. Dimensions,— $[e^{\frac{1}{2}}\ m^{\frac{1}{2}}\ t^{-\frac{1}{2}}\ t^{-1}]$; $[\mu^{-\frac{1}{2}}\ m^{\frac{1}{2}}\ t^{-\frac{1}{2}}]$.

Surface density of magnetism.—Quantity of magnetism per unit area. Dimensions,— $[e^{-1}\ m^{\frac{1}{2}}\ t^{-\frac{1}{2}}]$, $[\mu^{\frac{1}{2}}\ m^{\frac{1}{2}}\ t^{-\frac{1}{2}}\ t^{-1}]$.

Surface tension.—Two fluids in contact exhibit phenomena, due to molecular attractions which appear to arise from a tension in the surface of separation. It may be expressed as dynes per cm or as ergs per square centimeter. Dimensions,— $[m\ t^{-2}]$.

The total force along a line of length l on the surface of a liquid whose surface tension is T ,

$$F = lT.$$

Capillary tubes.—If a liquid of density d rises a height h in a tube of internal radius r the surface tension is,

DEFINITIONS AND FORMULAE (Continued)

$$T = \frac{rhdg}{2}$$

The tension will be in dynes per cm if r and h are in cm, d in g per cm³ and g in cm per sec².

Drops and bubbles.—Pressure in dynes per cm² due to surface tension on a drop of radius r cm for a liquid whose surface tension is T dynes per cm,

$$P = \frac{2T}{r}$$

For a bubble of mean radius r cm,

$$P = \frac{4T}{r}$$

Susceptibility (magnetic) is measured by the ratio of the intensity of magnetization produced in a substance to the magnetizing force or intensity of field to which it is subjected. The susceptibility of a substance will be unity when unit intensity of magnetization is produced by a field of one gauss. Dimensions, $[\epsilon^{-1} l^{-2} t^2]$; $[\mu]$.

A **chemical symbol** is not only an abbreviation of the name but represents one atom and one gram atomic weight of that element.

Tangent galvanometer.—A tangent galvanometer with n turns, of radius r , in the earth's field H , has a deflection θ . The current flowing is,

$$i = \frac{Hr}{2\pi n} \tan \theta$$

If $\frac{2\pi n}{r} = G$ (the galvanometer constant).

$$i = \frac{H}{G} \tan \theta$$

Temperature may be defined as the condition of a body which determines the transfer of heat to or from other bodies. The customary unit of temperature is the **Centigrade degree**, $\frac{1}{100}$ the difference between the temperature of melting ice and that of water boiling under standard atmospheric pressure. The degree **Fahrenheit** is $\frac{1}{180}$, and the degree **Beaumur** $\frac{1}{80}$ the same difference of temperature.

The fundamental temperature scale is the absolute, thermodynamic or **Kelvin scale** in which the temperature measure is based on the average kinetic energy per molecule of a perfect gas. The zero of the Kelvin scale is -273.18°C . The temperature scale adopted by the International Bureau of Weights and Measures is that of the constant volume hydrogen gas thermometer. The magnitude of the degree in both these scales is defined as $\frac{1}{100}$ the difference between the temperature of melting ice and that of boiling water at 760 mm pressure.

DEFINITIONS AND FORMULAE (Continued)

Temperature resistance coefficient.—The ratio of the change of resistance in a wire due to a change of temperature of 1°C to its resistance at 0°C . Dimension,— $[\theta^{-1}]$.

Thermal capacity of a substance is the quantity of heat necessary to produce unit change of temperature in unit mass. It is ordinarily expressed as calories per gram per degree Centigrade. Numerically equivalent to specific heat.

Thermal capacity or water equivalent.—The total quantity of heat necessary to raise any body or system unit temperature, measured as calories per degree centigrade in the cgs system. Dimension,— $[m]$.

Thermal expansion.—The coefficient of linear expansion or expansivity is the ratio of the change in length per degree $^{\circ}\text{C}$ to the length at 0°C . The coefficient of volume expansion (for solids) is approximately three times the linear coefficient. The coefficient of volume expansion for liquids is the ratio of the change in volume per degree to the volume at 0°C . The value of the coefficient varies with temperature. The coefficient of volume expansion for a gas under constant pressure is nearly the same for all gases and temperatures and is equal to 0.00367 for 1°C . Dimension,— $[\theta^{-1}]$.

If l_0 is the length at 0°C , α the coefficient of linear expansion, the length at $t_0^{\circ}\text{C}$ is,

$$l_t = l_0(1 + \alpha t).$$

General formula for thermal expansion.—The rate of thermal expansion varies with the temperature. The general equation giving the magnitude m_t (length or volume) at a temperature t , where m_0 is the magnitude at 0°C , is

$$m_t = m_0(1 + \alpha t + \beta t^2 + \gamma t^3 \dots)$$

where α , β , γ , etc. are empirically determined coefficients.

Volume expansion.—If V represents volume and β the coefficient of expansion,

$$V_t = V_0(1 + \beta t).$$

For solids,

$$\beta = 3\alpha \text{ (approximately).}$$

Thermodynamics, law of.

I. When mechanical work is transformed into heat or heat into work, the amount of work is always equivalent to the quantity of heat.

II. It is impossible by any continuous self-sustaining process for heat to be transferred from a colder to a hotter body.

Thermoelectric power is measured by the electromotive force produced by a thermocouple for unit difference of temperature between the two junctions. It varies with the average temperature and is usually expressed in microvolts per degree $^{\circ}\text{C}$. It is customary to list the thermoelectric power of the various metals with respect to lead. Dimensions,— $[\epsilon^{-1} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} t^{-1} \theta^{-1}]$.

DEFINITIONS AND FORMULAE (Continued)

Thomson thermoelectric effect is the designation of the potential gradient along a conductor which accompanies a temperature gradient. The magnitude and direction of the potential varies with the substance.

The coefficient of the Thomson effect or specific heat of electricity is expressed in joules per coulomb per degree Centigrade. Dimensions,— $[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}]$; $[\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2} \theta^{-1}]$.

Time, unit of.—The second, $_{86100}1$ of a mean solar day. One of the three fundamental units of the cgs system.

Torque produced by the action of one magnet on another.—The turning moment experienced by a magnet of pole strength m' and length $2l'$ placed at a distance r from another magnet of length $2l$ and pole strength m , where the center of the first magnet is on the axis (extended) of the second and the axis of the first is perpendicular to the axis of the second,

$$C = 8 \frac{mm'l'l'}{r^3} = \frac{2MM'}{r^3}$$

If the first magnet is deflected through an angle θ , the expression becomes,

$$C = \frac{2MM'}{r^3} \cos \theta$$

Torsional vibration.—See *Angular harmonic motion*.

Total reflection.—When light passes from any medium to one in which the velocity is greater, refraction ceases and total reflection begins at a certain critical angle of incidence θ such that

$$\sin \theta = \frac{1}{n}$$

where n is the index of the first medium with respect to the second. If the second medium is air n has the ordinary value for the first medium. For any other second medium,

$$n = \frac{n_1}{n_2}$$

where n_1 and n_2 are the ordinary indices of refraction for the first and second medium respectively.

Tractive force of a magnet.—If a magnet with induction B has a pole face of area A the force, is,

$$F = \frac{B^2 A}{8\pi}$$

If B and A are in cgs units, F will be in dynes.

Triangle or polygon of forces.—If three or more forces acting on the same point are in equilibrium, the vectors representing them form, when added, a closed figure.

Uniform circular motion.—If r is the radius of a circle, t the linear speed in the arc, ω the angular velocity and T the

DEFINITIONS AND FORMULAE (Continued)

period or time of one revolution,

$$\omega = \frac{v}{r} = \frac{2\pi}{T}$$

The acceleration toward the center is

$$a = \frac{v^2}{r} = \omega^2 r = \frac{4\pi^2 r}{T^2}$$

The centrifugal force for a mass m ,

$$F = \frac{mv^2}{r} = m\omega^2 r = \frac{4\pi^2 mr}{T^2}$$

In the above equations ω will be in radians per second and a in cm per sec^2 if r is in cm , v in cm per sec and T in sec . F will be in dynes if mass is in grams and other units as above.

Application to the solar system.—If M is the mass of the sun, G the constant of gravitation, P the period of the planet and r the distance of the planet from the sun, then the mass of the sun

$$M = \frac{4\pi^2 r^3}{GP^2}, \quad (G = 6.670 \times 10^{-8} \text{ for cgs units}).$$

If P is the period and r the distance of a satellite revolving around the planet, the above expression for M gives the mass of the planet. The formula is written on the assumption that the orbit of the planet or satellite is circular, which is only approximately true.

Uniformly accelerated rectilinear motion.—If v_0 is the initial velocity, v_t the velocity after time t , the acceleration,

$$a = \frac{v_t - v_0}{t}$$

The velocity after time t ,

$$v_t = v_0 + at$$

Space passed over in time t ,

$$s = v_0 t + \frac{1}{2} at^2$$

Velocity after passing over space s ,

$$v_s = \sqrt{v_0^2 + 2as}$$

Space passed over in the n th second

$$s = v_0 + \frac{1}{2} a(2n - 1).$$

In the above and following similar equations the values of the space, velocity, and acceleration must be substituted in the same system. For space in cm , velocity will be in cm per sec and acceleration in $\text{cm per sec per sec}$.

Unit.—Specific magnitude of a quantity, set apart by appropriate definition, which is to serve as a basis of comparison or measurement for other quantities of the same nature.

Valence of an atom of an element is that property which is measured by the number of atoms of hydrogen (or its equiva-

DEFINITIONS AND FORMULAE (Continued)

lent) one atom of that element can hold in combination if negative, or can displace in a reaction if it is positive.

Valence electrons of the atom are electrons which are gained, lost or shared in chemical reactions.

Van't Hoff's principle.—If the temperature of interacting substances in equilibrium is raised, the equilibrium concentrations of the reaction are changed so that the products of that reaction which absorb heat are increased in quantity, or if the temperature for such an equilibrium is lowered, the products which evolve heat in their formation are increased in amounts.

Van der Waal's variation of Boyle's law.

$$(p + \frac{a}{v^2})(v - b) = RT$$

where p and v are the pressure and volume at any constant temperature and a and b are constants. R is the gas constant and T the absolute temperature. For values of R , a and b see tables.

Vectors, composition of.—If the angle between two vectors is A , and their magnitude a and b , their resultant,

$$C = \sqrt{a^2 + b^2 + 2ab \cos A}.$$

Velocity.—Time rate of motion in a fixed direction. Cgs units,—one centimeter per second. Dimensions,— $[l t^{-1}]$.

If s is space passed over in time t , the velocity,

$$v = \frac{s}{t}$$

Velocity of a compressional wave.—The velocity of a compressional wave in an elastic medium, in terms of elasticity E (bulk modulus) and density d ,

$$V = \sqrt{\frac{E}{d}}$$

For the velocity of sound in air, where p is the pressure and d the density,

$$V = \sqrt{\frac{1.4p}{d}}$$

Velocity of efflux of a liquid.—If h is the distance from the opening to the free surface of the liquid, the velocity of efflux is

$$V = \sqrt{2gh}$$

The above is the theoretical discharge velocity disregarding friction and the shape of orifice. For water issuing through a circular opening with sharp edges of area, A , the volume discharged per second is given approximately by,

$$Q = 0.62A \sqrt{2gh}$$

DEFINITIONS AND FORMULAE (Continued)

Velocity of sound, variation with temperature.—The velocity in meters per sec at any temperature t in $^{\circ}\text{C}$ is given approximately by

$$V = V_0 \sqrt{1 + \frac{t}{273}}$$

$$V = 331.5 + .607t$$

The **variation with humidity** is given by the equation

$$V_d = V_h \sqrt{1 - \frac{e}{p} \left(\frac{\gamma_w}{\gamma_a} - \frac{5}{8} \right)}$$

where V_d is the velocity in dry air, V_h that in air at barometric pressure p in which the pressure of water vapor is e . γ_w and γ_a are the specific heat ratios for water vapor and for air respectively.

Velocity of a transverse wave in a stretched cord. If T is the tension of the cord and m the mass per unit length,

$$V = \sqrt{\frac{T}{m}}$$

Velocity of water waves.—If the depth h is small compared with the wave length, the velocity,

$$V = \sqrt{gh}$$

In deep water for a wave length λ ,

$$V = \sqrt{\frac{g\lambda}{2\pi}}$$

If the wavelength is very small, less than about 1.6 cm, the velocity increases as the wave length decreases and is expressed by the following,

$$V = \sqrt{\frac{2\pi T}{\lambda d} + \frac{g\lambda}{2\pi}}$$

where T is the surface tension and d the density of the liquid. V will be given in cm per sec if h and λ are in cm, g in cm per sec², T in dynes per cm and d in g per cm³.

Velocity of a wave.—The velocity of propagation in terms of wavelength λ and the period T or frequency n is,

$$V = \frac{\lambda}{T} = n\lambda$$

Viscosity.—All fluids possess a definite resistance to change of form and many solids show a gradual yielding to forces tending to change their form. This property, a sort of internal friction, is called viscosity; it is expressed in dyne-seconds per cm² or poises. Dimensions,—[$m\ l^{-1}\ t^{-1}$]. If the tangential force per unit area, exerted by a layer of fluid upon one adjacent is one dyne for a space rate of variation of the tangential velocity of unity, the viscosity is one poise.

Kinematic viscosity is the ratio of viscosity to density.

DEFINITIONS AND FORMULAE (Continued)

Flow of liquids through a tube; where l is the length of the tube, r its radius, p the difference of pressure at the ends, η the coefficient of viscosity, the volume escaping per second,

$$v = \frac{\pi pr^4}{8l\eta} \text{ (Poiseuille).}$$

The volume will be given in cm^3 per second if l and r are in cm , p in dynes per cm^2 and η in poises per dyne-seconds per cm^2 .

Visibility is measured by the ratio of the luminous flux in lumens to the total radiant energy in ergs per second or in watts.

Volume, unit of.—The cubic centimeter, the volume of a cube whose edges are one centimeter in length. Other units of volume are derived in a similar manner. Dimension,— $[l^3]$.

Wave motion.—A progressive disturbance propagated in a medium by the periodic vibration of the particles of the medium. Transverse wave motion is that in which the vibration of the particles is perpendicular to the direction of propagation. Longitudinal wave motion is that in which the vibration of the particles is parallel to the direction of propagation.

Weight.—The force with which a body is attracted toward the earth. Cgs unit,—the dyne. Dimensions,— $[m l t^{-2}]$.

Although the weight of a body varies with its location, the weights of various standards of mass are often used as units of force as,—pound weight, or pound force, gram weight, etc. The weight of mass m , where g is the acceleration due to gravity,

$$W = mg.$$

The weight will be given in dynes when m is in grams and g in cm per sec^2 .

Wien's displacement law.—When the temperature of a radiating black body increases, the wave length corresponding to maximum energy decreases in such a way that the product of the absolute temperature and wave length is constant.

$$\lambda_{\text{max}} T = w$$

w is known as **Wien's displacement constant**.

Wheatstone's bridge.—If the resistances r_1 , r_2 , r_3 , and r_4 form the arms of a Wheatstone's bridge in order as the circuit (omitting cell and galvanometer connections) is traced, when the bridge is balanced,

$$\frac{r_1}{r_2} = \frac{r_4}{r_3} \quad \text{or} \quad \frac{r_1}{r_4} = \frac{r_2}{r_3}$$

Work.—When a force acts against resistance to produce motion in a body the force is said to do work. Work is measured by the product of the force acting and the distance moved through against the resistance. Cgs units of work,—the erg, a force of one dyne acting through a distance of one centimeter. The joule is 1×10^7 ergs. Dimensions,— $[m l^2 t^{-2}]$. The foot-

DEFINITIONS AND FORMULAE (Continued)

pound is the work required to raise a mass of one pound a vertical distance of one foot where $g = 32.174$ ft./sec². The foot-poundal is the work done by a force of one poundal acting through a distance of one foot. The International joule, a unit of electrical energy, is the work expended per second by a current of one International ampere flowing through one International ohm. The kilowatt-hour is the total amount of energy developed in one hour by a power of one kilowatt.

If a force F act through a space s , the work done is

$$W = Fs$$

Work will be given in ergs if F is in dynes and s in cm

Work done in rotation. If a torque L dyne-cm acts through an angle θ radians, the work done in ergs is

$$W = L\theta$$

Zeeman effect.—The splitting of a spectrum line into several symmetrically disposed components, which occurs when the source of light is placed in a strong magnetic field. The components are polarized, the directions of polarization and the appearance of the effect depending on the direction from which the source is viewed relative to the lines of force.

MEASURES AND UNITS

FUNDAMENTAL STANDARDS

The primary standard of **length** is defined as the distance between two lines at 0°C on a platinum-iridium bar known as the **International Prototype Meter** deposited at the International Bureau of Weights and Measures. The International Prototype Meter is 1553164.13 times the wave length of the red cadmium line in air, 760 mm pressure, 15°C .

The primary standard of **mass** is defined as the mass of the **International Prototype Kilogram** of platinum-iridium kept at the International Bureau of Weights and Measures at Sèvres. It is equal to the mass of 0.001000027 cubic meter of pure water at 4°C and 760 mm pressure.

The primary standard of **capacity** is the **liter** which is the volume of one kilogram of pure water at the temperature of maximum density and under normal atmospheric pressure.

The primary standard of **time** is the **mean solar second**, one eighty six thousand four hundredth ($\frac{1}{86400}$) part of a mean solar day.

The standard scale of **temperature** adopted by the International Committee of Weights and Measures 1887 is based on the variations in pressure of hydrogen at constant volume. The hydrogen is taken at an initial pressure, at the temperature of melting ice, of one meter of mercury (0°C , sea level, latitude 45°). The scale is defined by taking the temperature of melting ice as 0° and that of condensing steam under 760 mm pressure as 100° . This is known as the Centigrade ($^{\circ}\text{C}$) scale.

The **absolute** or **thermodynamic temperature scale** proposed by Lord Kelvin is based on the average kinetic energy per molecule of a perfect gas. The temperature of melting ice is 273.15° and that of the boiling point of water 373.15° . This is frequently referred to as the Kelvin (K) scale.

MASS

Note: Three systems are in use,—avoirdupois, troy and apothecaries'. The grain is the same in all.

AVOIRDUPOIS—COMMERCIAL

The U. S. Standard pound avoirdupois is defined as 453.5924277 grams.

Grains (gr.)	Drams (dr. av.)	Ounces (oz. av.)	Pounds (lb. av.)	Tons (short) (tn.)	Metric equivalent
1	0 03657143			. .	0 064798918 g
27 34375	1	0 0625			1 771845 g
437 5	16	1	0 0625	.	28 349527 g
7,000	256	16	1	0 0005	453 5924 g
		32,000	2,000	1	0 4535924 kg 907 18486 kg

1 pound avoirdupois is the mass of 27 692 cubic inches of water weighed in air at 4° C, 760 mm pressure

1 short hundredweight (cwt) = 100 pounds = 45 359243 kilograms.

1 short ton = 20 short hundredweight = 2,430 56 troy pounds = 907.18486 kilograms

1 stone (British) = 14 pounds = 6.350 kilograms

1 quarter (British) = 28 pounds = 12 70 kilograms.

1 long hundredweight (British) = 4 quarters = 112 pounds = 50 802352 kilograms

1 long ton (British) = 20 long hundredweight = 1,016 04704 kilograms

1 long ton = 1.12000 short tons = 2,722.22 troy pounds = 1 01605 metric tons.

1 short ton = 0.892857 long ton = 29,166.66 troy or apothecaries' ounces = 0 907185 metric ton.

1 avoirdupois pound = 1 21528 troy or apothecaries' pounds = 14.5833 troy ounces.

1 avoirdupois ounce = 0 911458 troy or apothecaries' ounce

TROY WEIGHT

Grains (gr.)	Pennyweights (dwt.)	Ounces (oz. t.)	Pounds (lb. t.)	Metric equivalent
1	0 041667	0 0020833		{ 64 798918 mg 0 064798918 g

			365 256	1 (sidereal)

1 lunar month (mo.) = 29 days 12 hours 44 minutes.

1 sidereal second = 0.997270 mean solar second.

ANGLE

Seconds ($''$)	Minutes ($'$)	Degrees ($^{\circ}$)	Circum- ference	Radians
1	0 0166667	0 000277778	0 00000771605	0 00000484814
60	1	0166667	0000462963	000290888
3,600	60	1	00277778	0174533
1 296,000	21,600	360	1	6 28319
206 265	3,437 75	57 2958	0 159155	1

1 radian = $57^{\circ} 17' 44.8'' = 1/2\pi$ of a circumference

2π radians = $360^{\circ} = 1$ circumference

π radians = 180° .

$\pi/2$ radians = 90°

$\pi/4$ radians = 45° .

1 grade = $\frac{1}{400}$ of a circumference = 100 centesimal minutes = 0 0157079 radian

1 centesimal minute = 100'' centesimal seconds

SOLID ANGLE

1 steradian = $1/4\pi$ of the solid angle around a point.

UNITS AND CONVERSION FACTORS

Each unit named is followed by its equivalent in one or more other units of the same quantity. While the list of equivalents is incomplete it is intended to include all those which will be in common use

Symbols in the dimensional formulae given after the headings have the following significance: *m*, mass, *l*, length; *t*, time; *θ*, temperature; *ε*, dielectric constant of a vacuum; *μ*, permeability of a vacuum.

Mass, Length, Time, Angle, Area and Volume

Acre (A.) (U. S.).—0 0015625 square mile, 10 square chains (Gunter's), 160 square rods or square perches; 4840 square yards; 4.3560×10^4 square feet, 1×10^6 square links (Gunter's), 0.4046873 hectare or square hectometer, 40 46873 ares or square dekameters; 4046.873 square meters

Acre (A.) (British).—4 roods (British), 4840 square yards (British); 0.4046849 hectare or square hectometer, 4046 849 square meters

Ångström Unit (Å. or Å. U.).— $3\,937 \times 10^{-9}$ inch, 0.003937 millionths of an inch, 1×10^{-10} meter, 1×10^{-8} centimeter, 1×10^{-4} micron (*μ*); 0 1 milli-micron or micro-millimeter; 100 millionth microns or micro-microns (*μμ*)

Are (a).— 3.8610×10^{-5} square mile, 0.02471044 acre (U. S.); 119.60 square yards; 1076.4 square feet, 0.01 hectare, 1 square dekameter, 100 square meters

Astronomical unit.— $1\,495 \times 10^8$ kilometers

Bag (British).—3 bushels (dry), 0 109107 cubic meter.

Barleycorn (British).—1/3 inch, 0.84667 centimeter

Barrel (bbl.) (U. S., dry).—3.281 bushels, 105.0 quarts (dry); 7056 cubic inches for dry commodities except cranberry barrel which=5826 cubic inches; 0 11562 cubic meter

Barrel (bbl.) (U. S., liquid).—31.5 gallons, 0 11924 cubic meter

Barrel (bbl.) (British, dry).—36 gallons (British), 0 16366 cubic meter

Board Foot (bd. ft.).—1/12 cubic foot, 144 cubic inches (1 foot×1 foot×1 inch); 2359.8 cubic centimeters

Bolt (U. S., cloth).—120 linear feet; 36.576 meters.

Bucket (British, dry).—4 gallons (British); 1.8184×10^4 cubic centimeters.

UNITS AND CONVERSION FACTORS (Continued)

Bushel (bu.) (U. S., dry).—0.304785 barrel; 0.96895 bushel (British); 1.2444 cubic feet, 4 pecks, 32 quarts (dry); 64 pints (dry); 2150.42 cubic inches; 0.035239 cubic meter; 0.35238 hectoliter, 3.5238 dekaliters; 35.238 liters; 3.5239×10^4 cubic centimeters.

Bushel (bu.) (British, dry).— $\frac{1}{8}$ or 0.125 quarter (British, capacity); $\frac{1}{3}$ or 0.33333 bag (British); 1.03205 bushels (U. S.); 1.2843 cubic feet; 8 gallons (British); 2219.3 cubic inches; 0.363677 hectoliter; 3.63677 dekaliters; 36.3677 liters; 3.6369×10^4 cubic centimeters.

Butt (British, dry).—126 gallons; 0.57281 cubic meter.

Cable Length (British & U. S.).—720 feet; 219.46 meters.

Carat (c) (metric)—3.08647 grains; 0.2 gram; 200 milligrams

Carat (c) (1877).—3.168 grains, 205.6 milligrams.

Cental—100 pounds, 45.359 kilograms.

Centare (ca).—1.196 square yards, 10.764 square feet; 1550 square inches; 0.01 are, 1 square meter

Centigram (cg).—0.1543236 grain; 0.01 gram.

Centiliter (cl).—0.33815 ounce (fluid, U. S.); 0.61025 cubic inch; 2.705179 drams (fluid, U. S.); 0.01 liter; 10.00027 cubic centimeters.

Centimeter (cm).—0.01093611 yard (U. S.); 0.01093614 yard (British); 0.032808 foot (U. S. or British); 0.39370 inch (U. S. or British), 4.4330 lignes (Paris lines); 393.70 mils; 0.01 meter; 10 millimeters; 1×10^4 microns; 1×10^7 milli-microns or micro-millimeters; 1×10^8 Ångström units.

Chain (ch.) (Engineer's or Ramden's).—100 feet; 100 links of 1 foot each; 30.4801 meters

Chain (ch.) (Surveyor's or Gunter's).—0.1 furlong; 0.0125 mile, 4 rods; 22 yards; 66 feet, 100 links; 792 inches; 20.117 meters; 2011.7 centimeters

Chaldron (U. S., d.y)—*36 bushels (U. S.); 1.2686 cubic meters

Chaldron (British, dry).—*32 bushels (British); 1.1638 cubic meters

Circle (cir)— 2π or 6.2832 radians, 12 signs; 360 degrees.

Circular Inch.—Area of circle, diameter of which is one inch; 0.78540 square inch; 5.0671 square centimeters.

Circular Mil.—Area of circle, diameter of which is one mil

*Variable.

or $1/1000$ inch; 7.854×10^{-7} square inch; 0.78540 square mil; 5.0671×10^{-6} square centimeter; 5.0671×10^{-4} square millimeter.

Circular Millimeter.—0.0078540 square centimeter; 0.78540 square millimeter.

Circumference.— 2π or 6.28319 radians; 360 degrees; 400 grades; $2\,1600 \times 10^4$ minutes; $1\,296000 \times 10^6$ seconds.

Clove or Customary Stone (British).—8 pounds; 3.6287 kilograms.

Coomb (British, dry).—4 bushels; 0.14548 cubic meter.

Cord (cd.).—8 cord feet; 128 cubic feet (8 feet \times 4 feet \times 4 feet); 3.625 cubic meters.

Cord-Foot (cd. ft.)— $\frac{1}{8}$ or 0.125 cord; 16 cubic feet (4 feet \times 4 feet \times 1 foot).

Cubic Centimeter (cm³).— 1.3079×10^{-6} cubic yard; 2.7496×10^{-6} bushel (British); 2.83776×10^{-6} bushel (U. S.); 3.531445×10^{-6} cubic foot (U. S.); 3.531477×10^{-6} cubic foot (British); 2.1997×10^{-4} gallon (British); 2.6417×10^{-4} gallon (U. S.); 4.2376×10^{-4} board foot; 8.7988×10^{-4} quart (liquid, British); 9.0808×10^{-4} quart (dry, U. S.); 0.0010567 quart (liquid, U. S.); 0.0018162 pint (dry, U. S.); 0.0021134 pint (liquid, U. S.); 0.033814 ounce (fluid, U. S.); 0.035195 ounce (fluid, British); 0.061023 cubic inch; 0.27051 dram (fluid, U. S.); 0.28157 drachm (fluid, British); 16.231 minims (U. S.); 16.894 minims (British); 1×10^{-6} cubic meter; 9.9997×10^{-4} liter; 0.001 cubic decimeter; 0.99997 milliliter; 1000 cubic millimeters.

Cubic Decimeter (dm³).—0.0013079 cubic yard; 0.035314 cubic foot; 61.023 cubic inches; 0.001 cubic meter; 0.99997 liter; 1000 cubic centimeters.

Cubic Dekameter (dkm³).—1000 cubic meters.

Cubic Foot (ft.³ or cu. ft.) (U. S.).— $1/128$ or 0.0078125 cord. 0.01 register ton (British); $1/27$ or 0.037037 cubic yard; $1/16$ or 0.0625 cord-foot; 0.77861 bushel (British); 0.80357 bushel (U. S.); 6.229 gallons (British); 7.481 gallons (U. S.); 12 board feet; 25.714 quarts (dry, U. S.); 29.922 quarts (liquid, U. S.); 59.844 pints (liquid, U. S.); 1728 cubic inches; 0.02831701 cubic meter; 28.316 liters; 2.8317×10^4 cubic centimeters.

Cubic Foot (ft.³ or cu. ft.) (British).—0.02831677 cubic meter; 2.831677×10^4 cubic centimeters.

Cubic Inch (in.³ or cu. in.) (U. S.).— 2.143347×10^{-5} cubic yard; 4.65025×10^{-4} bushel (U. S.); 5.78704×10^{-4} cubic foot; 0.00186010 peck; 0.0043290 gallon (U. S.); $1/144$ or 0.006944 board foot; 0.014881 quart (dry, U. S.); 0.017316 quart (liquid, U. S.); 0.0297616 pint (dry); 0.5541 ounce (fluid); 4.4329 drams

UNITS AND CONVERSION FACTORS (Continued)

(fluid); 1.6387162×10^{-5} cubic meter; 0.0163868 liter; 1.63868 centiliters; 16.3868 milliliters; 16.387162 cubic centimeters; 1.6387162×10^4 cubic millimeters.

Cubic Inch (in.³ or cu. in.) (British).— 4.5081×10^{-4} bushel (British); 5.7870×10^{-4} cubic foot (British); 0.0018031 peck (British); 0.003606 gallon (British); 16.3870253 cubic centimeters.

Cubic Hectometer (hm³).— 1×10^6 cubic meters.

Cubic Kilometer (km³).— 1×10^9 cubic meters.

Cubic Meter (m³).—0.2759 cord; 1.3079428 cubic yards (U. S.); 1.307954 cubic yards (British); 28.3776 bushels (U. S.); 35.314445 cubic feet (U. S.); 35.31477 cubic feet (British); 264.173 gallons (U. S.); 1056.7 quarts (liquid); 2113.4 pints (liquid, U. S.); 6.1023×10^4 cubic inches; 1 stere; 999.973 liters; 1000 cubic decimeters; 1×10^6 cubic centimeters; 1×10^9 cubic millimeters.

Cubic Millimeter (mm³).— 6.1023×10^{-5} cubic inch; 0.01623 minim (U. S.); 0.01689 minim (British); 1×10^{-9} cubic meter; 0.001 cubic centimeter.

Cubic Yard (yd.³ or cu. yd.) (U. S.).—27 cubic feet; 168.17 gallons (British); 202.0 gallons (U. S.); 807.9 quarts (liquid, U. S.); 1616 pints (liquid, U. S.); 4.6656×10^4 cubic inches; 0.76455945 cubic meter; 764.54 liters; 7.6455945×10^6 cubic centimeters.

Cubic Yard (yd.³ or cu. yd.) (British).—27 cubic feet; 0.76455285 cubic meter.

Cubit.—18 inches; 45.72 centimeters.

Dalton.— $1/16$ the mass of an atom of oxygen; 1.650×10^{-24} gram.

Day (da) (tropical, mean solar).—24 hours (mean solar); 1440 minutes (mean solar); 8.6400×10^4 seconds (mean solar).

Day (da) (sidereal).— 8.6164×10^4 seconds (mean solar).

Decigram (dg.).—1.543236 grains; 0.1 gram.

Deciliter (dl).—0.176 pint (British); 3.38147 ounces (fluid, U. S.); 0.1 liter; 100.0027 cubic centimeters.

Decimeter (dm).—0.3280833 foot (U. S.); 0.3280843 foot (British); 3.93700 inches (U. S.); 3.937011 inches (British); 0.1 meter.

Decistere (ds).—0.1 stere or cubic meter.

Degree (°).— $1/360$ or 0.0027778 circumference or revolution; $1/90$ or 0.01111 quadrant; 0.017453 radian; 60 minutes; 3600 seconds.

Dekagram (dkg).—0.35273957 ounce (avoirdupois); 5.64383 drams (avoirdupois); 0.01 kilogram; 10 grams.

UNITS AND CONVERSION FACTORS (Continued)

Dekaliter (dkl).—0.27497 bushel (British); 0.28378 bushel (U. S.); 1.13513 pecks (U. S.); 9.08102 quarts (U. S., dry); 18.162 pints (dry, U. S.); 10 liters; 10.00027 cubic decimeters.

Dekameter (dkm).—1.98838 rods (U. S.); 10.93611 yards (U. S.); 10.93614 yards (British); 393.70 inches; 10 meters.

Dekastere (dks).—10 steres or cubic meters.

Drachm (fluid) (dr. fl. or $\bar{3}$ fl.) (British).— $\frac{1}{8}$ or 0.125 ounce (fluid, British); 60 minims; 3.5515 cubic centimeters.

Dram (apothecaries' or troy) (dr. ap. or t. or $\bar{3}$ ap. or t.)—(Same as British Drachm)—0.008571429 pound (avoirdupois); $\frac{1}{96}$ or 0.010416667 pound (apothecary or troy); $\frac{1}{8}$ or 0.12500 ounce (apothecary or troy); 0.1371429 ounce (avoirdupois); 2.194286 drams (avoirdupois); 2.5 pennyweights; 3 scruples; 60 grains; 3.8879351 grams.

Dram (avoirdupois) (dr. av. or $\bar{3}$ av.).— $\frac{1}{256}$ or 0.00390625 pound (avoirdupois); 0.0047471788 pound (apothecary or troy); 0.056966146 ounce (apothecary or troy); 0.0625 ounce (avoirdupois); 0.4557292 dram (apothecary or troy); 1.139323 pennyweights; 1.3671875 scruples; 27.34375 grains; 1.771845 grams; 1771.845 milligram.

Dram (fluid) (dr. fl. or $\bar{3}$ fl.) (U.S.).—0.00390625 quart (liquid, U. S.); 0.0078125 pint (liquid, U. S.); 0.03125 gill (U. S.); $\frac{1}{8}$ or 0.125 ounce (fluid); 0.225586 cubic inch; 60 minims; 3.6966 milliliters; 3.6967 cubic centimeters.

Ell.—45 inches; 114.30 centimeters.

Em, Pica (printing industry).— $\frac{1}{6}$ or 0.16667 inch; 0.42333 centimeter.

Fathom (fath.) (nautical).—6 feet, 1.828804 meter.

Firkin (fir.) (U. S.).—9 gallons (U. S.); 34.068 liters.

Firkin (fir.) (British).—9 gallons (British); 40.914 liters.

Fluid Ounce (fl. oz.)—See Ounce (Fluid).

Foot (ft.) (U. S.).— 1.6447×10^{-4} mile (nautical); 1.893939×10^{-4} mile (statute); 0.00151515 furlong; 0.0151515 chain (Gunter's); 0.0606061 rod; $\frac{1}{6}$ or 0.16667 fathom; $\frac{1}{3}$ or 0.33333 yard; 12 inches; 0.3048006 meter, 30.48006 centimeter; 473404 wave-lengths of red line of cadmium.

Foot (ft.) (British).—0.4 pace (British); 30.47997 centimeters.

Foot (Paris).—(See Pied).

Furlong (fur.) (U. S. or British).— $\frac{1}{8}$ or 0.125 mile (U. S.); 10 chains (Gunter's); 40 rods, 220 yards; 660 feet; 201.168 meters.

UNITS AND CONVERSION FACTORS (Continued)

Gallon (gal.) (U.S.).—1 U. S. gallon of water at 62°F weighs 3.7820 kilograms or 8.337 pounds (avoirdupois); 0.004951 cubic yard; 0.031746 barrel (liquid, U. S.); 0.13368 cubic foot; 0.83268 gallons (British); 4 quarts (liquid); 8 pints (liquid); 32 gills; 128 ounces (fluid); 231.00 cubic inches; 6.1440×10^4 minims; 0.0037854 cubic meter; 3.7853 liters; 3785.4 cubic centimeters.

Gallon (gal.) (British Imperial) (Canadian).—1 British gallon of water at 62°F has a mass of 10 pounds (avoirdupois); 0.02778 barrel (dry, British); $\frac{1}{8}$ or 0.125 bushel (dry, British); 0.16054 cubic foot; 0.5 peck (British); 1.20094 gallons (U. S.); 4 quarts (liquid, British); 8 pints (liquid, British); 32 gills (liquid, British); 160 ounces (fluid, British); 277.3 cubic inches; 1.54596 liters; 4546.1 cubic centimeters.

Geepound—See Slug.

Gill (gi.) (U. S.).— $\frac{1}{32}$ or 0.03125 gallon (U. S.); $\frac{1}{8}$ or 0.125 quart (liquid, U. S.); $\frac{1}{4}$ or 0.25 pint (liquid, U. S.); 4 ounces (fluid); 7.21875 cubic inches; 32 drams (fluid); 1920 minims; 0.118292 liters; 118.295 cubic centimeters.

Gill (gi.) (British).— $\frac{1}{32}$ or 0.03125 gallon (British); $\frac{1}{4}$ or 0.25 pint (liquid, British); 5 ounces (fluid, British); 0.14206 liter; 142.07 cubic centimeters.

Grade— $\frac{1}{400}$ or 0.0025 circumference; 0.0157079 radian; 0.9 degree; 100 centesimal minutes.

Grain (gr.).— $\frac{1}{7000}$ or 1.42857×10^{-4} pound (avoirdupois); $\frac{1}{5760}$ or 1.736111×10^{-4} pound (apothecary or troy); 0.0020833 ounce (apothecary or troy); 0.0022857 ounce (avoirdupois); 0.016667 dram (apothecary or troy); 0.03657143 dram (avoirdupois); 0.0416667 pennyweight (troy); 0.05000 scruple (apothecary); 0.064798918 gram; 0.3240 carat (metric); 64.798918 milligram.

Gram (g).—0.00220462 pound (avoirdupois); 0.00267923 pound (apothecary or troy); 0.0321507 ounce (apothecary or troy); 0.0352739 ounce (avoirdupois); 0.257206 dram (apothecary or troy); 0.564383 dram (avoirdupois); 0.6430149 pennyweight; 0.771618 scruple; 15.4324 grains; 1×10^{-6} ton (metric); 1×10^{-4} myriagram; 0.001 kilogram; 5 carats (metric); 1000 milligrams; 1×10^6 microgram.

Hand.—4 inches; 10.160 centimeters.

Hectare (ha)—2.471044 acres (U. S.); 2.471058 acres (British); 395.367 square rods (U. S.); 1.195985×10^4 square yards (U. S.); 1.0764×10^6 square feet; 100 ares; 1×10^4 square meters.

Hectogram (hg).—3.52739 ounces (avoirdupois); 100 grams.

UNITS AND CONVERSION FACTORS (Continued)

Hectoliter (hl).—2.7497 bushels (British); 2.8378 bushels (U. S.); 11.3513 pecks (U. S.); 100 liters.

Hectometer (hm).—19.8838 rods; 109.3611 yards (U. S.); 109.3614 yards (British); 328.08 feet (U. S.); 100 meters.

Hemisphere.—0.5 sphere; 4 spherical right angles; 6.2832 steradians.

Hogshead (hhd.) (British).—63 gallons (British); 10.114 cubic feet; 0.28640 cubic meters.

Hogshead (hhd.) (U. S.).—63 gallons (U. S.); 8.4218 cubic feet; 0.23848 cubic meter.

Hour (hr.) (tropical, mean solar).—0.0059524 week; 0.041667 day (mean solar); 60 minutes (mean solar); 3600 seconds (mean solar).

Hundredweight (cwt.) (short).—100 pounds; 0.044643 ton (long); 0.05 ton (short); 4 quarters (British); 1600 ounces (avoirdupois); 0.0453592 ton (metric); 45.3592 kilograms.

Hundredweight (cwt.) (long).—112 pounds; 0.05 ton (long); 4 quarters (British); 50.8023 kilograms.

Inch (in.) (U. S.).— 1.57828×10^{-5} mile; 0.00126263 chain (Gunter's); 0.00505051 rod; $1/36$ or 0.027778 yard; $1/12$ or 0.08333 foot; 0.126263 link (Gunter's); 72 points (printer's type); 1000 mils; 2.540005 centimeter; 25.40005 millimeters; 2.5400×10^8 Ångström unit; 39450.33 wave lengths of red line of cadmium.

Inch (in.) (British).— $1/36$ or 0.027778 yard (British); $1/9$ or 0.1111 quarter (British, linear); 2.539998 centimeters; 25.39998 millimeter.

Inch (Paris).—See Pouce.

Kilderkin (British).—18 gallons (British); 0.081830 cubic meter.

Kilogram (kg).— 9.842064×10^{-4} ton (long); 0.0011023112 ton (short); 0.019684 hundredweight (long); 0.022046223 hundredweight (short); 0.07874 quarter (British); 2.2046223 pounds (avoirdupois); 2.6792285 pounds (apothecary or troy); 32.150742 ounces (apothecary or troy); 35.273957 ounces (avoirdupois); 257.21 dram (apothecary or troy); 564.38 dram (avoirdupois); 643.01 pennyweight; 771.62 scruples; 1.54324×10^4 grains; 0.001 ton (metric); 1000 grams.

Kiloliter (kl).—1.3080 cubic yards; 35.316 cubic feet; 264.18 gallons (liquid, U. S.); 1.000027 cubic meters; 1000 liters.

Kilometer (km).— 1.0567×10^{-13} light year; 0.53961 mile (nautical); 0.62137 mile (statute); 1093.6 yards; 3280.8 feet; 0.1 myriameter; 1000 meters; 1×10^5 centimeters.

UNITS AND CONVERSION FACTORS (Continued)

Minute (min.) (time).— 9.9206×10^{-5} week; 6.94446×10^{-4} day; 0.016667 hour; 60 seconds.

Month (mo.) (mean calendar).—30.42 days; 730 hours; 4.3800×10^4 minutes; 2.628×10^6 seconds.

Month (mo.) (lunar).—29 days 12 hours 44 minutes.

Myriagram (Mg).—22.04622 pounds (avoirdupois); 10 kilograms; 1×10^4 grams.

Myriameter (Mm).—6.21372 miles; 10 kilometers; 1×10^4 meters.

Nail (British).—2.25 inch; 5.715 centimeters.

Noggin (British).— $1/32$ or 0.03125 gallon (liquid); 142.06 cubic centimeters.

Ounce (Fluid) (oz. fl. or $\frac{3}{8}$ fl.) (U. S.).— $1/128$ or 0.0078125 gallon (U. S.); 0.03125 quart (liquid, U. S.); $1/16$ or 0.0625 pint (liquid); $\frac{1}{4}$ or 0.25 gill (U. S.); 1.80469 cubic inches; 8 drams (fluid); 480 minims; 0.0295729 liter; 0.295729 deciliter; 29.5729 milliliters; 29.5737 cubic centimeters.

Ounce (fluid) (oz. fl. or $\frac{3}{8}$ fl.) (British).—0.006250 gallon (British); 8 drachms (fluid, British); 480 minims; 28.4130 cubic centimeters.

Ounce (avoirdupois) (oz. av. or $\frac{3}{8}$ av.).— 2.790179×10^{-5} ton (long); 3.125×10^{-5} ton (short); 6.25×10^{-4} hundredweight (short); $1/16$ or 0.062500 pound (avoirdupois); 0.075954861 pound (apothecary or troy); 0.9114583 ounce (apothecary or troy); 7.29166 drams (apothecary or troy); 16 drams (avoirdupois); 18.22917 pennyweights; 21.875 scruples (apothecary); 437.5 grains; 2.83495×10^{-5} ton (metric); 28.349527 grams.

Ounce (apothecary or troy) (oz. 'ap. or t. or $\frac{3}{8}$ ap. or t.).— 3.4285×10^{-5} ton (short); 0.06857143 pound (avoirdupois); 0.08333 pound (apothecary or troy); 1.09714 ounces (avoirdupois); 8 drams (apothecary or troy); 17.55428 drams (avoirdupois); 20 pennyweights (troy); 24 scruples; 480 grains; 31.103481 grams; 3.1103481×10^4 milligrams.

Pace.— $2\frac{1}{2}$ feet; 30 inches (British); 76.2 centimeters.

Palm (British).—3 inches; 7.62 centimeters.

Parsec.— 19×10^{12} miles; 3.084×10^{13} kilometers.

Peck (pk.) (U. S.).— $\frac{1}{4}$ or 0.25 bushel; 8 quarts; 16 pints; 537.605 cubic inches; 0.880958 dekaliter; 8.80958 liters.

Peck (pk.) (British).—2 gallons (British); 554.6 cubic inches; 9.0919 liters.

Pennyweight (dwt.) (troy).—0.003428571 pound (avoirdupois); 0.0041667 pound (apothecary or troy); $1/20$ or 0.05

UNITS AND CONVERSION FACTORS (Continued)

ounce (apothecary or troy); 0.0548571 ounce (avoirdupois); 0.8777143 dram (avoirdupois); 24 grains; 1.55517 grams; 1555.17 milligrams.

Perch (British & U. S.).—1 rod; 16.5 feet; 5.0292 meters.

Perch (masonry).—24.75 cubic feet.

Pied (French foot).— $1/6$ or 0.16667 toise (French); 12 Paris inches; 0.3248 meter.

Pint (pt.) (dry, U. S.).— $1/64$ or 0.015625 bushel; 0.0625 peck; 0.5 quart; 33.600 cubic inches; 0.550599 liter; 550.61 cubic centimeters.

Pint (pt.) (liquid, U. S.).— 6.1881×10^{-4} cubic yard; 0.016711 cubic foot; $1/8$ or 0.125 gallon (U. S.); 0.5 quart (U. S.); 0.83268 British pint; 4 gills (U. S.); 16 fluid ounces (U. S.); 28.875 cubic inches; 128 fluid drams; 7680 minims; 0.473167 liter; 473.167 milliliters; 473.179 cubic centimeters.

Pint (pt.) (liquid, British).— $1/8$ or 0.125 gallon (British); 0.5 quart (British); 1.20094 U. S. pints; 4 gills (British); 20 fluid ounces (British); 0.56825 liter; 568.25 milliliters; 568.26 cubic centimeters.

Point (printer's type).— $1/72$ or 0.01389 inch; 0.035278 centimeter.

Pole (British).—1 rod; 5.5 yards; 16.5 feet; 5.0292 meters.

Pottle (British).— $1/2$ gallon (liquid); 2.273 cubic decimeters.

Pouce (Paris inch).— $1/12$ or 0.083333 pied or Paris foot; 12 lignes or Paris lines; 2.70700 centimeters.

Pound (avoirdupois) (lb. av.) (U. S. or British).—Is the mass of 27.692 cubic inches of water weighed in air at 4° C, 760 mm pressure; 4.464286×10^{-4} ton (long); 5×10^{-4} ton (short); 0.0089286 hundredweight (long); 0.01 hundredweight (short); 1.2152778 pounds (apothecary or troy); 14.5833 ounces (apothecary or troy); 16 ounces (avoirdupois); 116.6667 drams (apothecary or troy); 256 drams (avoirdupois); 291.6667 pennyweights; 350.01 scruples; 7000 grains; 4.5359243×10^{-4} ton (metric); 0.4535924 kilogram; 453.5924 grams.

Pound (apothecary or troy) (lb. ap. or t.) (U. S. or British).— 3.6735×10^{-4} ton (long); 4.1143×10^{-4} ton (short); 0.822857 pound (avoirdupois); 12 ounces (apothecary or troy); 13.165714 ounces (avoirdupois); 96 drams (apothecary or troy); 210.6514 drams (avoirdupois); 240 pennyweights; 288 scruples; 5760 grains; 3.7324×10^{-4} ton (metric); 0.3732418 kilogram; 373.2418 grams.

Puncheon (British).—70 gallons (British); 84 wine gallons; 0.31823 cubic meter.

Quadrant.—1.57080 radians; 90 degrees; 5400 minutes.

UNITS AND CONVERSION FACTORS (Continued)

Quart (qt.) (U. S., dry).— $1/32$ or 0.03125 bushel; 0.038889 cubic foot; $1/8$ or 0.125 peck; 2 pints (dry); 67.2006 cubic inches; 1.10120 liters; 1101.23 cubic centimeters.

Quart (qt.) (U. S., liquid).—0.033421 cubic foot; $1/4$ or 0.25 gallon; 2 pints (liquid); 8 gills; 32 ounces (fluid); 57.749 cubic inches; 256.00 drams (fluid); 0.946333 liter; 946.358 cubic centimeters.

Quart (qt.) (British, liquid).— $1/4$ gallon (British); 2 pints (liquid, British); 1.13650 liters; 1136.52 cubic centimeters.

Quarter (U. S., mass).— $1/4$ short ton or 500 pounds; 226.795 kilograms.

Quarter (U. S., mass).— $1/4$ long ton or 560 pounds; 254.01 kilograms.

Quarter (British, capacity)—8 bushels; 2.909 hectoliters.

Quarter (British, linear).—1 span; $1/4$ yard; 9 inches; 22.860 centimeters.

Quarter (British, mass).— $1/4$ short hundredweight or 25 pounds; 11.340 kilograms.

Quarter (British, mass).— $1/4$ long hundredweight or 28 pounds; 12.70 kilograms.

Quartern (British, dry).— $1/2$ gallon; 2273.1 cubic centimeters.

Quartern (British, liquid).— $1/32$ gallon; 142.07 cubic centimeters.

Quintal (q) (metric).—1.96841 hundredweights (long); 220.46 pounds; 100 kilograms; 1×10^5 grams.

Quintal* (q) (U. S. or British).—100 or 112 pounds.

Quire.—25 sheets.

Radian.— $1/2\pi$ or 0.159155 circumference or revolution; 0.637 quadrant; 57.29578 degrees; $57^\circ 17' 44.8''$; 3437.75 minutes; 2.06265×10^5 seconds.

Ream.—500 sheets.

Register Ton (British).—100 cubic feet; 2.8317 cubic meters.

Revolution.—4 quadrants; 2π or 6.2832 radians; 360 degrees.

Rod (rd.) (surveyor's measure).—0.003125 mile; 0.025 furlong; 0.25 chain (Gunter's); 1 perch; 5.5 yards; 16.5 feet; 25 links; 198 inches; 5.029210 meters.

Rod (rd.) (British, volume).—1000 cubic feet; 28.317 cubic meters.

*Variable.

UNITS AND CONVERSION FACTORS (Continued)

Rood (British).— $\frac{1}{4}$ or 0.25 acre; 40 square perches; 1210 square yards; 10.117 ares or square dekameters.

Rope (British).—20 feet; 6.0960 meters.

Sack (British).—3 bushels; 0.10911 cubic meter.

Scruples (apothecary) (s. ap. or ℥).—0.002857143 pound (avoirdupois); 0.003472222 pound (apothecary or troy); 0.041667 ounce (apothecary or troy); 0.0457143 ounce (avoirdupois); $\frac{1}{3}$ or 0.33333 dram (apothecary or troy); 0.7314286 dram (avoirdupois); 0.833333 pennyweight; 20 grains; 1.2959784 grams; 1295.9784 milligrams.

Seam (British).—8 bushels; 0.29095 cubic meter.

Second (Angle) (").— 4.84814×10^{-6} radian; 2.7778×10^{-4} degree; 0.016667 minute.

Second (sec) (time, mean solar).— 1.1574×10^{-5} day (mean solar); 1.1606×10^{-5} day (sidereal); 2.7778×10^{-4} hour (mean solar); 0.016667 minute (mean solar); 1.00273791 seconds (sidereal).

Second (sec) (time, sidereal).—0.997270 second (mean solar).

Sign (s).—30 degrees.

Skein.—360 feet; 109.73 meters.

Slug.—1 geepound; 32.174 pounds; 14.594 kilograms.

Space, Entire (solid angle).— 4π or 12.5664 steradians.

Span.— $\frac{1}{8}$ fathom; 1 quarter (British, linear); 9 inches; 22.86005 centimeters.

Sphere (solid angle).—2 hemispheres; 4π or 12.5664 steradians.

Spherical Right Angle.— $\frac{1}{8}$ or 0.125 sphere; $\frac{1}{4}$ or 0.25 hemisphere; $\pi/2$ or 1.5708 steradians.

Square Centimeter (cm²).— 2.47104×10^{-7} square chain; 3.95367×10^{-6} square rod; 1.1960×10^{-4} square yard; 0.0010764 square foot; 0.00247104 square link; 0.15500 square inch; 1.5500×10^8 square mils; 1.9735×10^8 circular mils; 127.32 circular millimeters; 1×10^{-4} square meter; 0.01 square decimeter; 100 square millimeters.

Square Chain (sq. ch.) (Gunter's).— 1.5625×10^{-4} square mile; 16 square rods; 484 square yards; 4356 square feet; 1×10^4 square links; 6.27264×10^8 square inches; 404.6873 square meters.

Square Decimeter (dm²).—15.500 square inch; 0.01 square meter; 100 square centimeters.

UNITS AND CONVERSION FACTORS (Continued)

Square Degree.— 3.0462×10^{-4} steradian.

Square Dekameter (dkm²).—0.02471044 acre (U. S.); 119.60 square yards; 1 are; 100 square meters.

Square Foot (ft.² or sq. ft.) (U. S.).— 3.58701×10^{-8} square mile; 2.29568×10^{-5} acre; 2.29568×10^{-4} square chain; 0.00367309 square rod; $1/9$ or 0.111111 square yard; 2.29568 square links; 144 square inches; 9.290341×10^{-4} are; 0.09290341 square meter; 929.0341 square centimeters.

Square Foot (ft.² or sq. ft.) (British).—0.09290289 square meter.

Square Hectometer (hm²).—2.471044 acres (U. S.); 2.471058 acres (British); 1×10^4 square meters.

Square Inch (in.² or sq. in.) (U. S.).— 1.59423×10^{-6} square chain; $1/144$ or 0.0069444 square foot; $1/1296$ or 0.000771605 square yard; 0.0159423 square link; 1×10^6 square mils; 1.27324 $\times 10^6$ circular mils; 6.4516258×10^{-4} square meter; 6.4516258 square centimeters; 645.16258 square millimeters.

Square Inch (in.² or sq. in.) (British). 6.4515898 square centimeters.

Square Kilometer (km²).—0.3861006 square mile (U. S.); 247.1044 acres (U. S.); 247.1058 acres (British); 1.1960×10^6 square yards; 1.0764×10^7 square feet; 1×10^6 square meters.

Square Link (li.² or sq. li.) (Gunter's).— 1×10^{-5} acre; 1×10^{-4} square chain; 0.0016 square rod; 0.0484 square yard; 0.4356 square foot; 62.7264 square inches; 0.040469 square meter; 404.69 square centimeters.

Square Meter (m²).— 3.8610×10^{-7} square mile; 2.471044×10^{-4} acre (U. S.); 2.471058×10^{-4} acre (British); 0.00247104 square chain (Gunter's); 0.039537 square rod; 1.195985 square yards (U. S.); 1.195992 square yards (British); 10.76387 square feet (U. S.); 10.76390 square feet (British); 24.7104 square links (Gunter's); 1550.0 square inches; 1×10^{-6} square kilometer; 1×10^{-4} hectare or square hectometer; 0.01 are; 1 centare 1×10^4 square centimeters; 1×10^6 square millimeters.

Square Mil.— 1×10^{-6} square inch; 1.2732 circular mils; 6.4516×10^{-6} square centimeter; 6.4516×10^{-4} square millimeter.

Square Mile (mi.² or sq. mi.).—640 acres; 6400 square chains; 1.02400×10^6 square rods; 3.0976×10^6 square yards; 2.78784×10^7 square feet; 2.589998 square kilometers; 258.9998 hectares; 2.589998×10^6 square meters.

Square Millimeter (mm²).—0.0015500 square inch; 1550.0 square mils; 1973.5 circular mils; 1×10^{-6} square meter; 0.01 square centimeter; 1.2732 circular millimeters.

UNITS AND CONVERSION FACTORS (Continued)

Square Perch (British & U. S.).— $1/160$ or 0.00625 acre; 30.25 square yards; 25.293 square meters.

Square Pole (British).—30.25 square yards.

Square Rod (rd. ² or sq. rd.).— 9.765625×10^{-6} mile; 0.00625 acre; 0.0625 square chain (Gunter's); 30.25 square yards; 272.25 square feet; 625 square links (Gunter's); 3.9204×10^4 square inches; 0.0025293 hectare or square hectometer; 25.293 square meters or centares.

Square Yard (yd. ² or sq. yd.) (U. S.).— 3.22831×10^{-7} square mile; 2.06612×10^{-4} acre; 0.00206612 square chain; 0.0330579 square rod or square perch; 9 square feet; 20.6612 square link 1296 square inches; 8.36131×10^{-4} hectare; 0.0083613 square dekameter or are; 0.83613 square meter or centare; 8361.31 square centimeters.

Square Yard (yd. ² or sq. yd.) (British).— 2.0661×10^{-4} acre (British); 8.2645×10^{-4} rood (British); 0.836126 square meter.

Steradian.— $\frac{1}{4}\pi$ of the solid angle around a point; 0.07958 sphere; 0.15916 hemisphere; 0.6366 spherical right angle; 3282.8 square degrees.

Stere (s).—0.1 dekastere; 1 cubic meter; 10 decisteres; 999.973 liters.

Stone (British).—14 pounds (avoirdupois); 6.350 kilograms.

Strike (British).—2 bushels (dry); 0.072738 cubic meter.

Toise (French).—6 Paris feet; 1.9490365 meters (legal, 1799); 1.949090 meters (measured, 1887).

Ton (long) (tn. l.) (U. S. or British).—1.12000 tons (short); 22.400 hundredweights (short); 2240 pounds (avoirdupois); 2722.22 pounds (apothecary or troy); 3.5840×10^4 ounces (avoirdupois); 1.0160470 metric tons; 1016.0470 kilograms.

Ton (short) (tn. sh.) (U. S.).—0.89286 ton (long); 20 hundredweights (short); 2000 pounds (avoirdupois); 2430.56 pounds (apothecary or troy); 2.916666×10^4 ounces (apothecary or troy); 3.2000×10^4 ounces (avoirdupois); 0.907185 ton (metric); 907.185 kilograms.

Tonne (t) (metric ton, millier).—0.984206 ton (long); 1.10231 tons (short); 22.046223 hundredweights (short); 2204.62 pounds (avoirdupois); 2679.23 pounds (apothecary or troy); 3.527396×10^4 ounces (avoirdupois); 1000 kilograms; 1×10^6 grams.

Township (U. S.).—36 square miles; 2.3040×10^4 square yards; 93.240 square kilometers.

Tun.—252 gallons.

Week (wk.).—168 hours; 1.0080×10^4 minutes; 6.04800×10^5 seconds.

UNITS AND CONVERSION FACTORS (Continued)

Wey (British, capacity).—*40 bushels.

Wey (British, mass).—*252 pounds.

Yard (yd.) (U. S.).— 5.68182×10^{-4} mile; 0.00454545 furlong; 0.0454545 chain (Gunter's); 0.181818 rod; 3 feet; 4.54545 links (Gunter's); 36 inches; 3600/3937 or 0.91440183 meter; 91.440183 centimeters.

Yard (yd.) (British).—0.18182 pole (British); $\frac{4}{9}$ quarters (British, linear); 0.9143992 meter (present legal equivalent of Imperial yard); 91.43992 centimeters; 1.420212×10^6 wave lengths of red line of cadmium.

Year (yr.) (leap).—366 days; 8784 hours.

Year (yr.) (tropical, mean[solar]).—365.2422 day (mean solar); 8765.8128 hours (mean solar); 3.15569×10^7 seconds (mean solar).

Year (yr.) (sidereal).—365.256 days (mean solar); 8766.144 hours (mean solar).

*Variable.

RECIPROCAL UNITS

x per Ångström = $1 \times 10^8 x$ per centimeter.

x per circular mil = $1.9735 \times 10^6 x$ per square centimeter.

x per circular millimeter = $127.324 x$ per square centimeter.

x per circumference = $0.159155 x$ per radian.

x per cubic foot = $3.5314 \times 10^{-6} x$ per cubic centimeter.

x per cubic inch = $0.061023 x$ per cubic centimeter.

x per cubic yard = $1.3079 x$ per cubic meter.

x per day (mean solar) = $1.15741 \times 10^{-6} x$ per second (mean solar).

x per degree = $57.29578 x$ per radian.

x per entire space = $0.079577 x$ per steradian.

x per foot = $0.032808 x$ per centimeter.

x per gallon (British) = $2.1997 \times 10^{-4} x$ per cubic centimeter.

x per gallon (U. S.) = $2.6417 \times 10^{-4} x$ per cubic centimeter.

x per grain = $0.01543236 x$ per milligram.

x per hemisphere = $0.15916 x$ per steradian.

x per hour (mean solar) = $2.77778 \times 10^{-4} x$ per second (mean solar).

Velocity [$l t^{-1}$]

Centimeter per second.— 3.728×10^{-4} mile per minute; 0.02237 mile per hour; 0.032808 foot per second; 0.03600 kilometer per hour; 0.6000 meter per minute; 1.9685 feet per minute.

UNITS AND CONVERSION FACTORS (Continued)

Degree per second.—0.002778 revolution per second; 0.017453 radian per second; 0.1667 revolution per minute.

Foot per minute.—0.005080 meter per second; 0.011364 mile per hour; 0.016667 foot per second; 0.01829 kilometer per hour; 0.3048 meter per minute; 0.5080 centimeter per second.

Foot per second.—0.011364 mile per minute; 0.5921 knot per hour; 0.6818 mile per hour; 1.0973 kilometers per hour; 18.29 meters per minute; 30.4801 centimeters per second.

Kilometer per hour.—0.016667 kilometer per minute; 0.27778 meter per second; 0.5396 knot; 0.6214 mile per hour; 0.9113 foot per second; 16.67 meters per minute; 27.7778 centimeters per second; 54.68 feet per minute.

Kilometer per minute.—0.6215 mile per minute; 37.284 miles per hour; 60 kilometers per hour; 1666.7 centimeters per second; 3280.8 feet per minute.

Knot.—1 nautical mile per hour; 1.1516 miles per hour; 1.689 feet per second; 1.853 kilometers per hour; 51.48 centimeters per second; 6080.20 feet per hour.

Meter per minute.—0.03728 mile per hour; 0.05468 foot per second; 0.06 kilometer per hour; 1.6667 centimeters per second; 3.281 feet per minute.

Meter per second.—0.03728 mile per minute; 0.06000 kilometer per minute; 2.2369 miles per hour; 3.281 feet per second; 3.600 kilometers per hour; 196.8 feet per minute.

Mile per hour.—0.016667 mile per minute; 0.8684 knot; 1.4667 feet per second; 1.6093 kilometers per hour; 26.82 meters per minute; 44.7041 centimeters per second; 88 feet per minute.

Mile per minute.—52.104 knot; 1.609 kilometers per minute; 60 miles per hour; 88 feet per second; 2682.2 centimeters per second.

Radian per second.—0.1592 revolution per second; 9.549 revolutions per minute; 57.296 degrees per second.

Revolution per day.— 7.2722×10^{-5} radian per second.

Revolution per minute (R.P.M.).—0.01667 revolution per second; 0.10472 radian per second; 6 degrees per second.

Revolution per second.—6.2832 radians per second; 60 revolutions per minute; 360 degrees per second.

Velocity of light.— 2.9986×10^{10} centimeters per second.

UNITS AND CONVERSION FACTORS (Continued)

Acceleration [$l\ t^{-2}$]

Centimeter per second per second.—0.02237 mile per hour per second; 0.03281 foot per second per second; 0.03600 kilometer per hour per second.

Foot per second per second.—0.304801 meter per second per second; 0.6818 mile per hour per second; 1.097 kilometer per hour per second; 30.4801 centimeter per second per second.

Gravity, standard.—32.174 feet per second per second; 980.665 centimeters per second per second.

Kilometer per hour per second.—0.27778 meter per second per second; 0.6214 mile per hour per second; 0.9133 foot per second per second; 27.778 centimeters per second per second.

Meter per second per second.—2.237 miles per hour per second; 3.2808 feet per second per second; 3.600 kilometers per hour per second; 100.00 centimeters per second per second.

Mile per hour per minute.—0.74507 centimeter per second per second.

Mile per hour per second.—0.44704 meter per second per second; 1.467 feet per second per second; 1.609 kilometers per hour per second; 44.704 centimeters per second per second.

Radians per second per second.—0.1592 revolution per second per second; 9.549 revolutions per minute per second; 572.96 revolutions per minute per minute.

Revolution per minute per second.—0.10420 radian per second per second.

Revolution per minute per minute.— 2.778×10^{-4} revolution per second per second; 0.0017453 radian per second per second; 0.01667 revolution per minute per second.

Revolution per second per second.—6.2832 radians per second per second; 60 revolutions per minute per second; 3600 revolutions per minute per minute.

Density [$m\ l^{-3}$]

Demal.—1 gram equivalent per cubic decimeter.

Grain per cubic foot.—2.288 grams per cubic meter.

Gram per cubic centimeter.— 3.405×10^{-7} pound per mil-foot; 0.03613 pound per cubic inch; 8.3452 pounds per gallon

UNITS AND CONVERSION FACTORS (Continued)

(U. S.); 10.022 pounds per gallon (British); 62.43 pounds per cubic foot.

Gram per cubic meter.—0.437 grains per cubic foot.

Gram per milliliter.—(Numerically equal to specific gravity $t^{\circ}/4^{\circ}$); 0.999973 gram per cubic centimeter.

Kilogram per cubic meter.— 3.613×10^{-6} pound per cubic inch; 0.001 gram per cubic centimeter; 0.06243 pound per cubic foot.

Mercury at 0°C .—13.5951 grams per cubic centimeter (Internationally accepted conventional value to be used in expressing pressures in terms of columns of mercury.)

Pound per cubic foot.— 5.787×10^{-4} pound per cubic inch; 0.016018 gram per cubic centimeter; 16.018 kilograms per cubic meter.

Pound per cubic inch.—27.680 grams per cubic centimeter; 2.768×10^4 kilograms per cubic meter.

Pound per mil foot.— 2.9369×10^6 grams per cubic centimeter.

Pound per gallon (U. S.).—0.119826 gram per cubic centimeter.

Pound per gallon (British).—0.099776 gram per cubic centimeter.

Slug per cubic foot.—0.5154 gram per cubic centimeter.

Mass Concentration

Gram per metric ton.—1.0000 milligram per kilogram.

Gram per ton (2000 pound).—1.1023 milligrams per kilogram.

Gram per ton (2240 pound).—0.9842 milligram per kilogram.

Karat (1 of gold to 24 of mixture).—41.667 milligrams per gram.

Milligram per assay ton (Equals one troy ounce per 2000 pound (avoirdupois)).—34.276 milligrams per kilogram.

Milligram per kilogram.—0.002 pound (avoirdupois) per ton (2000 pound); 0.029175 milligram per assay ton; 0.032000 ounce (avoirdupois) per ton (2000 pound); 1 gram per metric ton.

Ounce (avoirdupois) per ton (2000 pound).—31.2500 milligrams per kilogram.

UNITS AND CONVERSION FACTORS (Continued)

Ounce (avoirdupois) per ton (2240 pound).—27.9018 milligrams per kilogram.

Pound (avoirdupois) per ton (2000 pound).—500.000 milligrams per kilogram.

Pound (avoirdupois) per ton (2240 pound).—446.429 milligrams per kilogram.

Flow [l^3t^{-1}]

Cubic centimeter per second.—0.0021186 cubic foot per minute.

Cubic foot per minute.—0.1247 gallon per second; 0.4720 liter per second; 62.4 pounds of water per minute; 472.0 cubic centimeters per second.

Cubic foot per second.—2.2222 cubic yards per minute; 448.83 gallons per minute; 1699.3 liters per minute.

Cubic yard per minute.—0.45 cubic foot per second; 3.367 gallons per second; 12.74 liters per second.

Gallon per second.—0.297 cubic yard per minute; 8.0192 cubic feet per minute.

Gallon per minute.—0.002228 cubic foot per second; 0.06308 liter per second.

Liter per minute.— 5.885×10^{-4} cubic foot per second; 0.004403 gallon per second.

Liter per second.—0.078493 cubic yard per minute; 2.12 cubic feet per minute; 15.85 gallons per minute (U. S.).

Miner's Inch.—1.2 cubic feet per minute.

Pounds of water per minute.—0.01603 cubic foot per minute.

Force [mlt^{-1}]

Conversion factors between the absolute and gravitational units of force, torque, energy and power are dependent on the value of g , the acceleration due to gravity. The standard value of g adopted by the International Committee on Weights and Measures is 980.665 cm/sec². This value or its equivalent, 32.174 ft./sec², is used except where otherwise noted.

Dyne.— 2.2481×10^{-6} pound weight; 7.2330×10^{-5} poundal; 0.0010197 gram weight; 0.015737 grain weight.

Grain weight.—63.546 dynes.

Gram weight.—0.070932 poundal; 980.665 dynes.

UNITS AND CONVERSION FACTORS (Continued)

Kilogram weight.—70.932 pounds; 9.80665×10^5 dynes.

Poundal.—0.031081 pound weight; 14.098 grams weight;
 1.3825×10^4 dynes.

Pound weight.—32.174 pounds; 453.59 grams weight;
 4.4482×10^5 dynes.

Ton weight (2000 pound).— 8.8964×10^8 dynes.

Ton weight (2240 pound).— 9.9640×10^8 dynes.

RECIPROCAL FORCE [$m^{-1} l^{-1} t^2$]

x per gram weight = $0.0010197 x$ per dyne.

x per poundal = $7.2330 \times 10^{-5} x$ per dyne.

x per pound weight = $2.2481 \times 10^{-6} x$ per dyne.

Pressure [$m l^{-1} t^{-2}$]

Atmosphere (normal).—Pressure exerted by 76 cm of Hg, density 13.5951 g/cm³, $g = 980.665$ cm/sec²; 0.0073480 ton (2000 pound) per square inch; 1.0133 bars; 1.0581 tons (2000 pound) per square foot; 14.696 pounds per square inch; 29.921 inches of mercury at 32° F; 33.899 feet of water at 39.1° F; 760 millimeters of mercury at 0° C; 1033.2 grams per square centimeter; 2116.2 pounds per square foot; 1.0332×10^4 kilograms per square meter; 1.01325×10^6 dynes per square centimeter.

Bar.—0.98692 atmosphere; 14.504 pounds per square inch, 1.01971×10^4 kilograms per square meter; 1.000×10^6 dynes per square centimeter. (This value accords with the only internationally accepted use of this term; but "bar" has also been used to denote a pressure of one dyne per square centimeter).

Barye.—1.0000 dyne per square centimeter.

Centimeter of mercury at 0° C.—0.013158 atmosphere; 0.19337 pound per square inch; 0.44604 foot of water; 27.845 pounds per square foot; 135.95 kilograms per square meter; 1.33322×10^4 dynes per square centimeter.

Centimeter of water at 4° C.—980.638 dynes per square centimeter.

Dyne per square centimeter.— 9.8692×10^{-7} atmosphere; 1×10^{-6} bar; 1.4504×10^{-5} pound per square inch; 2.9530×10^{-5} inch of mercury at 32° F; 4.0148×10^{-4} inch of water at 4° C; 7.5006×10^{-4} millimeter of mercury; 0.00101971 gram per square centimeter; 0.00101974 centimeter of water at 4° C; 0.0020886 pound per square foot; 0.0101971 kilogram per square meter.

Foot of water at 4° C or 39.1° F.—0.029499 atmosphere; 0.43352 pound per square inch; 0.88265 inch of mercury at

UNITS AND CONVERSION FACTORS (Continued)

32°F; 62.426 pounds per square foot; 304.79 kilograms per square meter.

Gram (weight) per square centimeter.— 9.6784×10^{-4} atmosphere; 0.014223 pound per square inch; 0.73556 millimeter of mercury at 0°C; 2.0482 pound per square foot; 10 kilograms per square meter; 980.665 dynes per square centimeter.

Inch of mercury at 32°F.—0.033421 atmosphere; 0.49116 pound per square inch; 1.13299 feet of water at 39.1°F; 13.595 inches of water at 4°C; 70.727 pounds per square foot; 345.31 kilograms per square meter; 3.38639×10^4 dynes per square centimeter.

Inch of water at 4°C.—0.0024583 atmosphere; 0.036136 pound per square inch; 0.073554 inch of mercury; 0.57818 ounce per square inch; 5.2022 pounds per square foot; 25.399 kilograms per square meter; 2490.82 dynes per square centimeter.

Kilogram (weight) per square centimeter.—14.223 pounds per square inch; 73.556 centimeters of mercury at 0°C; 980,665 dynes per square centimeter.

Kilogram (weight) per square meter.— 9.6784×10^{-5} atmosphere; 0.0014223 pound per square inch; 0.0028959 inch of mercury; 0.0032809 foot of water; 0.073556 millimeter of mercury; 0.1 gram per square centimeter; 0.20482 pound per square foot; 98.0665 dyne per square centimeter.

Kilogram (weight) per square millimeter.—0.71114 ton (2000 pounds) per square inch; 1×10^6 kilograms per square meter; 9.80665×10^7 dynes per square centimeter.

Millimeter of mercury at 0°C.—0.0013158 atmosphere; 0.019337 pound per square inch; 1.3595 grams per square centimeter; 2.7845 pounds per square foot; 13.595 kilograms per square meter; 1333.22 dynes per square centimeter.

Ounce (weight) per square inch.—0.0625 pound per square inch; 4309.2 dynes per square centimeter.

Pound (weight) per square foot.— 4.7254×10^{-4} atmosphere; 4.7880×10^{-4} bar; 0.0069445 pound per square inch; 0.016018 foot of water at 39.1°F; 0.35913 millimeter of mercury at 0°C; 0.48824 gram per square centimeter; 4.8824 kilograms per square meter; 478.80 dynes per square centimeter.

Pound (weight) per square inch.— 5×10^{-4} ton (2000 pound) per square inch; 0.068046 atmosphere; 0.068947 bar; 0.070307 kilogram per square centimeter; 2.0360 inches of mercury at 32°F; 2.3066 feet of water at 39.1°F; 5.1715 centimeters of mercury at 0°C; 27.673 inches of water at 4°C; 51.715 millimeters of mercury; 70.307 grams per square centimeter; 703.07 kilograms per square meter; 6.8947×10^4 dynes per square centimeter.

UNITS AND CONVERSION FACTORS (Continued)

Ton (2000 pound) (weight) per square foot.—0.94509 atmosphere; 13.889 pounds per square inch; 9764.8 kilograms per square meter; 9.5760×10^5 dynes per square centimeter.

Ton (2240 pound) (weight) per square foot.— 10.7251×10^5 dynes per square centimeter.

Ton (2000 pound) (weight) per square inch.—1.4062 kilograms per square millimeter; 2000 pounds per square inch; 1.4062×10^6 kilograms per square meter; 1.3789×10^8 dynes per square centimeter.

Ton (2240 pound) (weight) per square inch.—1.5749 kilograms per square millimeter; 152.42 atmospheres; 1.5444×10^8 dynes per square centimeter.

Work and Energy [$m l^2 t^{-2}$]

British thermal unit (mean) (BTU).— 2.930×10^{-4} kilowatt-hour; 3.9292×10^{-4} horse power-hour; 0.25198 kilogram-calorie or large calorie (mean); 0.2930 watt-hour; 10.409 liter-atmospheres; 107.56 kilogram-meters; 251.98 gram-calories (mean); 777.97 foot-pounds; 1054.8 joules (absolute); 0.3676 cubic foot-atmospheres; 2.5030×10^4 foot-poundals; 1.0548×10^{10} ergs.

British thermal unit (39°F) (BTU).—1060.4 joules (absolute).

British thermal unit (60°F) (BTU).—1054.6 joules (absolute).

Calorie.—See gram-calorie or kilogram-calorie.

Centigrade thermal unit (15°C) (CTU).—1898.3 joules (absolute).

Centimeter-dyne.—See erg.

Centimeter-gram force.—See gram-centimeter.

Cheval-vapeur heure.— 2.6478×10^6 joules (absolute).

Cubic centimeter-atmosphere (normal).—0.101325 joule (absolute).

Cubic foot atmosphere.—2.7203 British thermal unit (mean); 28.313 liter-atmospheres; 292.59 kilogram-meters; 680.74 gram-calories (mean); 2116.3 foot-pounds; 2869.4 joules (absolute).

Erg.— 2.3889×10^{-11} kilogram-calorie (mean); 9.4805×10^{-11} British thermal unit (mean); 1.0197×10^{-8} kilogram-meter; 2.3889×10^{-8} gram-calorie (mean); 7.3756×10^{-8} foot-pound; 1×10^{-7} joule; 2.3730×10^{-6} foot-poundal; 0.0010197 gram-centimeter; 1 dyne-centimeter.

Foot-Pound.— 3.7662×10^{-7} kilowatt-hour; 5.0505×10^{-7} horse power-hour; 3.2389×10^{-4} kilogram-calorie (mean); 3.7662×10^{-4} watt-hour; 4.7253×10^{-4} cubic foot-atmosphere; 0.0012854 Brit-

UNITS AND CONVERSION FACTORS (Continued)

Force de cheval (cheval-vapeur).—*See* horse power (metric).

Gram-centimeter per second.— 9.80665×10^{-6} watt (absolute).

Hectowatt.—100 watts.

Horse power (h. p. or HP).—0.70696 British thermal unit (mean) per second; 0.7452 kilowatt ($g=980$); 0.74570 ($g=980.665$) kilowatt; 1.0139 horse power (metric) or cheval-vapeur; 10.688 kilogram-calories (mean) per minute; 42.418 British thermal units (mean) per minute; 550 foot-pounds per second; 745.2 watts ($g=980$); 745.70 watts ($g=980.665$); 3.3000×10^4 foot-pounds per minute.

Horse power, electrical (U. S. & British).—746.00 watt (absolute) (Commonly used in rating electrical machinery).

Horse power, metric (cheval vapeur).—0.98632 horse power (U. S.); 75 kilogram-meters per second; 735.499 watts; 3.2549×10^4 foot-pounds per minute.

Kilogram-calorie (mean) per minute.—0.093557 horse power; 51.457 foot-pounds per second; 69.767 watts.

Kilogram calorie (mean) per second.—4.186 kilowatts.

Kilogram-meter per second.—9.80665 watts (absolute).

Kilowatt.—0.23889 kilogram-calorie (mean) per second; 0.94827 British thermal unit (mean) per second; 1.3410 horse power; 1.3597 horse power (metric); 14.333 kilogram-calories (mean) per minute; 56.896 British thermal units (mean) per minute; 737.56 foot-pounds per second; 1000 watts; 4.4254×10^4 foot-pounds per minute; 2.6552×10^6 foot-pounds per hour.

Lumen.—0.001496 watt.

Metric horse power.—*See* horse power, metric.

Watt (absolute).—0.001 kilowatt; 0.0013410 horse power; 0.0013596 force de cheval or horse power (metric); 0.01433 kilogram-calorie (mean) per minute; 0.056896 British thermal unit (mean) per minute; 0.73756 foot-pound per second; 1 joule per second; 44.254 foot-pounds per minute; 1×10^7 ergs per second.

Watt (International) (v).—1.00032 watt (absolute).

Watt of maximum visibility radiation.—668 lumens.

UNITS AND CONVERSION FACTORS (Continued)

Action [$m l^2 t^{-1}$]

Calorie (15°C) second.— 6.3854×10^{33} quanta.

Calorie (15°C) second / N_0 *.— 1.0535×10^{10} quanta.

Joule second.— 1.5258×10^{33} quanta.

Joule second / N_0 *.— 2.5173×10^9 quanta.

Planck's quantum.— 6.554×10^{-27} erg second.

Volt electronic-charge second.— 2.4292×10^{14} quanta.

Volt faraday second.— 1.4724×10^{38} quanta.

* N_0 denotes Avogadro's number, the number of molecules per gram mole.

Torque or Moment of Force [$m l^2 t^{-2}$]

Dyne-centimeter.— 1.0197×10^{-8} kilogram-meter; 7.3757×10^{-6} pound-foot; 8.8511×10^{-7} pound-inch; 2.3731×10^{-6} poundal-foot.

Kilogram-meter.— 9.8066×10^7 dyne-centimeters.

Pound-foot.— 1.3558×10^7 dyne-centimeters.

Poundal-foot.— 4.2140×10^6 dyne-centimeters.

Pound-inch.— 1.1298×10^6 dyne-centimeters.

Moment of Area [l^4]

Square centimeter-centimeter squared.—0.02402 square inch-inch squared.

Square foot-foot squared.— 2.074×10^4 square inch-inch squared.

Square inch-inch squared.— 4.823×10^{-5} square foot-foot squared; 41.62 square centimeter-centimeter squared.

Moment of Inertia [$m l^2$]

Gram-centimeter squared ($g\text{ cm}^2$).— 2.3730×10^{-6} pound-foot squared; 3.4172×10^{-4} pound-inch squared.

Kilogram-centimeter squared.—0.0023730 pound-foot squared; 0.3417 pound-inch squared.

Pound-foot squared.—144 pound-inches squared; 421.40 kilogram-centimeters squared; 4.2140×10^5 gram-centimeters squared.

Pound-inch squared.—0.006945 pound-foot squared; 2.9264 kilogram-centimeters squared; 2926.4 gram-centimeters squared.

UNITS AND CONVERSION FACTORS (Continued)

Thermal Units

TEMPERATURE

Degree Centigrade ($^{\circ}\text{C}$).—0.8 or $4/5$ degree Réaumur; 1.00 degree absolute, Kelvin; 1.8 or $9/5$ degrees Fahrenheit.

Degree Fahrenheit ($^{\circ}\text{F}$).—0.44444 or $4/9$ degree Réaumur; 0.55556 or $5/9$ degree Centigrade.

Degree Réaumur ($^{\circ}\text{R}$).—1.25 or $5/4$ degrees Centigrade; 2.25 or $9/4$ degrees Fahrenheit.

Temperature, absolute Centigrade or Kelvin (K) scale.— $x^{\circ}\text{K} = T^{\circ}\text{C} + 273.18$.

Temperature, degrees Centigrade ($^{\circ}\text{C}$).— $x^{\circ}\text{C} = 5/9 (T^{\circ}\text{F} - 32)$; $x^{\circ}\text{C} = 5/4 T^{\circ}\text{R}$.

Temperature, degrees Fahrenheit ($^{\circ}\text{F}$).— $x^{\circ}\text{F} = 9/5 T^{\circ}\text{C} + 32$; $x^{\circ}\text{F} = 9/4 T^{\circ}\text{R} + 32$.

Temperature, degrees Réaumur ($^{\circ}\text{R}$).— $x^{\circ}\text{R} = 4/9 (T^{\circ}\text{F} - 32)$; $x^{\circ}\text{R} = 4/5 T^{\circ}\text{C}$.

THERMAL CAPACITY OF A SUBSTANCE

British thermal unit (mean) per pound per $^{\circ}\text{F}$.—1 gram-calorie per gram per $^{\circ}\text{C}$; 4.186 joules per gram per $^{\circ}\text{C}$.

Gram-calorie (mean) per gram per $^{\circ}\text{C}$.—1 British thermal unit (60°F) per pound per $^{\circ}\text{F}$; 4.186 joules per gram per $^{\circ}\text{C}$.

Joule per gram per $^{\circ}\text{C}$.—0.2389 gram-calorie (mean) per gram per $^{\circ}\text{C}$; 0.2389 British thermal unit (mean) per pound per $^{\circ}\text{F}$.

THERMAL CAPACITY OF A BODY. WATER EQUIVALENT

British thermal unit (60°F) per $^{\circ}\text{F}$.—453.59 gram-calories per $^{\circ}\text{C}$; 1898.3 joules per $^{\circ}\text{C}$.

Gram-calorie (15°) per $^{\circ}\text{C}$.—0.0022046 British thermal unit (60°F) per $^{\circ}\text{F}$; 4.185 joules per $^{\circ}\text{C}$.

Joule per $^{\circ}\text{C}$.— 5.268×10^{-4} British thermal unit (60°F) per $^{\circ}\text{F}$; 0.2389 gram-calorie per $^{\circ}\text{C}$.

HEAT EQUIVALENT. LATENT HEAT

British thermal unit (mean) per pound.—0.5556 gram-calorie (mean) per gram; 2.325 joules per gram.

UNITS AND CONVERSION FACTORS (Continued)

Gram-calories (mean) per gram.—1.8 British thermal units (mean) per pound; 4.186 joules per gram.

Joule per gram.—0.2389 gram-calories (mean) per gram; 0.4301 British thermal unit per pound.

THERMAL CONDUCTIVITY

British thermal unit (mean) per square foot per second for a temperature gradient of 1°F per inch=5.191 joules (absolute) per square centimeter per second for a temperature gradient of 1°C per centimeter=1.2404 gram-calories (15°C) per square centimeter per second for a temperature gradient of 1°C per centimeter.

Gram-calorie (15°C) per square centimeter per second for a temperature gradient of 1°C per centimeter=4.185 joules (absolute) per square centimeter per second for a temperature gradient of 1°C per centimeter=0.80620 British thermal units (mean) per square foot per second for a temperature gradient of 1°F per inch.

Joule per square centimeter per second for a temperature gradient of 1°C per centimeter=0.2389 gram-calorie (15°C) per square centimeter per second for a temperature gradient of 1°C per centimeter=0.1926 British thermal unit per square foot per second for a temperature gradient of 1°F per inch.

Photometric Units

Bougie Decimale (intensity of source).—1.0 International candle (approximately).

Candle (International) (intensity of source).—0.104 Carcel unit (approximately); 1.0000 International lumen per steradian; 1 Pentane candle (approximately); 1 English sperm candle (approximately); 1.11 Hefner unit (approximately).

Candle per square centimeter (surface brightness).—3.1416 lamberts; 3141.6 millilamberts.

Candle per square inch (surface brightness).—0.48695 lambert; 486.95 millilamberts.

Carcel unit (intensity of source).—9.6 International candle (approximately).

English sperm candle (intensity of source).—1.0 International candle (approximately).

Foot-candle (illumination of a surface).—1 lumen incident per square foot; 1.0764 milliphots; 10.764 lumen per square meter; 10.764 lux.

UNITS AND CONVERSION FACTORS (Continued)

Hefner unit (intensity of source).—0.90 International candle (approximately).

Lambert (surface brightness).—0.3183 candle per square centimeter; 2.054 candles per square inch; 1 lumen emitted per square centimeter of a perfectly diffusing surface.

Lumen (flux of luminous energy).—Is emitted by 0.07958 spherical candle power. A source of one spherical candle power emits 4π or 12.566 lumens.

Lumen per square centimeter per steradian (surface brightness).—3.1416 lambert.

Lumen per square foot (illumination of a surface).—1 foot-candle; 10.764 lumens per square meter.

Lumen per square foot per steradian (surface brightness).—3.3816 millilambert.

Lumen per square meter (surface illumination).— 1×10^{-4} phot; 0.092902 foot candle or lumen per square foot.

Lux (illumination of a surface).— 1×10^{-4} phot; 0.1 milliphot; 0.092902 foot-candle; 1.000 lumen per square meter.

Meter-candle (illumination of a surface).—1.000 lumen per square meter.

Millilambert (surface brightness).—0.929 lumen emitted per square foot (perfect diffusion).

Milliphot (illumination of a surface).—0.001 phot; 0.929 foot-candle.

Pentane candle (intensity of source).—1.0 International candle (approximately).

Phot (illumination of a surface).—1 lumen incident per square centimeter; 1000 milliphots; 1.000×10^4 lumens per square meter; 1×10^4 lux.

Stilb (surface brightness).—1 candle per square centimeter.

Viscosity

VISCOSITY [$ml^{-1} t^{-1}$]

Gram weight second per square centimeter.—980.665 poise.

Poise.—1.00 gram per centimeter per second.

Pound weight second per square foot.—478.8 poise.

Pound weight second per square inch.— 6.895×10^4 poise.

KINEMATIC VISCOSITY [$l^2 t^{-1}$]

Inch squared per second.—6.451 centimeters squared per second.

UNITS AND CONVERSION FACTORS (Continued)

Poise centimeter cubed per gram.—1.000 centimeter squared per second.

Poise foot cubed per pound.—62.43 centimeters squared per second.

Poise inch cubed per gram.—16.387 centimeters squared per second.

RECIPROCAL VISCOSITY (FLUIDITY) [$m^{-1} l$]

Rhe.—1.000 per poise.

Diffusivity; Coefficient of Diffusion [$l^2 t^{-1}$]

Centimeter squared per day.— 1.1574×10^{-5} centimeter squared per second.

Inch squared per second.—6.4516 centimeters squared per second.

Liter per centimeter per day.—0.011574 centimeter squared per second.

Surface Tension [mt^{-2}]

Dyne per centimeter.—0.01 erg per square millimeter; 0.10197 milligram weight per millimeter; 1 erg per square centimeter; 2.5901 milligram weight per inch.

Erg per square centimeter.—0.01000 erg per square millimeter; 1.0000 dyne per centimeter.

Erg per square millimeter.—100.00 dynes per centimeter; 100.00 ergs per square centimeter.

Milligram weight per inch.—0.38609 dyne per centimeter.

Milligram weight per millimeter.—9.80665 dynes per centimeter.

Rotatory Power [l^{-1}]

Degree per centimeter.—0.017453 radian per centimeter.

Degree per foot.— 5.7261×10^{-4} radian per centimeter.

Degree per inch.—0.0068714 radian per centimeter.

Minute per centimeter.— 2.9089×10^{-4} radian per centimeter.

Radian per centimeter.—57.296 degrees per centimeter; 145.50 degrees per inch; 1746.4 degrees per foot; 3437.7 minutes per centimeter.

UNITS AND CONVERSION FACTORS (Continued)

ELECTRICAL UNITS

Electrical units are designated as "absolute" when based on the electromagnetic cgs system, "International" when based on legal definitions of the ohm, Weston cell or silver voltammeter.

The basis of International units is indicated as follows: "(a)" based on a silver deposit of 1.11800 mg per International ampere second; "(v)" based on the International ohm and Weston cell, —1.018300 volts at 20°C.

Quantity or Charge [$\epsilon^{1/2}m^{1/2}t^{-1}$], [$\mu^{-1/2}m^{1/2}t^{1/2}$]

Abcoulomb.—See electromagnetic cgs unit electrical quantity.

Ampere-hour (absolute).—3600.0 coulomb (absolute)

Coulomb (absolute).—0.1000 electromagnetic cgs unit or abcoulomb; 1.00007 International coulombs (a); 1.00010 International coulombs (v); 2.99796×10^9 electrostatic cgs units or statcoulombs; 6.281×10^{18} electronic charges

Electromagnetic cgs unit or abcoulomb.—10.0000 coulombs (absolute); 2.99796×10^{10} electrostatic cgs units or statcoulombs

Electronic charge.— 1.5921×10^{-20} electromagnetic cgs unit or abcoulomb; 1.5921×10^{-19} coulomb (absolute), 4.774×10^{-10} electrostatic cgs unit or statcoulomb

Electrostatic cgs unit or statcoulomb.— 3.33560×10^{11} electromagnetic cgs unit or abcoulomb, 3.33560×10^{-10} coulomb (absolute), 2.0947×10^9 electronic charges

Electrostatic foot-pound second unit.— 1.1952×10^{-6} coulomb (absolute); 117.58 electromagnetic cgs units or abcoulombs; 3583.9 electrostatic cgs units or statcoulombs

Faraday.— 9.6500×10^4 coulombs (absolute); 9.6507×10^4 International coulombs (a), 9.6510×10^4 International coulombs (v); 2.89365×10^{14} electrostatic cgs units or statcoulombs

International coulomb (a).—0.99993 coulomb (absolute)

International coulomb (v).—0.99990 coulomb (absolute).

Statcoulomb.—See electrostatic cgs unit

RECIPROCAL QUANTITY [$\epsilon^{-1/2}m^{-1/2}t$]; [$\mu^{1/2}m^{-1/2}t^{1/2}$]

x per ampere-hour = $2.7778 \times 10^{-4} x$ per coulomb (absolute).

x per coulomb (absolute) = 0.99990 x per International coulomb (v); 0.99993 x per International coulomb (a).

UNITS AND CONVERSION FACTORS (Continued)

x per electromagnetic cgs unit = $0.1000 x$ per coulomb (absolute).

x per electronic charge = $6\,281 \times 10^{18} x$ per coulomb (absolute).

x per electrostatic cgs unit = $2\,99796 \times 10^9 x$ per coulomb (absolute)

x per faraday = $1\,0363 \times 10^{-5} x$ per coulomb (absolute)

Current [$\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} t^{-2}$]; [$\mu^{-\frac{1}{2}} m^{\frac{1}{2}} t^{-1}$]

Abampere.—See electromagnetic cgs unit.

Ampere (absolute).— 1.0363×10^{-5} faraday per second; 0.1 electromagnetic cgs unit or abampere; 1.00007 International amperes (a), 1.00010 International amperes (v), 2.99796×10^9 electrostatic cgs units or statamperes

Electromagnetic cgs unit or abampere.— 10.0000 amperes (absolute); $2\,99796 \times 10^{10}$ electrostatic cgs units or statamperes.

Electrostatic cgs unit or statampere.— 3.33560×10^{-11} electromagnetic cgs unit or abampere; 3.33560×10^{-10} ampere (absolute)

Faraday per second — 9.6500×10^4 ampere (absolute).

International ampere (a) —Based on the deposit of 0.00111800 grams of silver per second; $0\,99993$ ampere (absolute)

International ampere (v) —As defined by the International ohm and volt, $0\,99990$ ampere (absolute)

International ampere (U S before 1911) — 0.99916 International ampere (v)

International ampere (England before 1906) — $0\,99870$ International ampere (v)

International ampere (England 1906-8).— 0.99894 International ampere (v)

International ampere (England 1909-10) — 0.99990 International ampere (v)

International ampere (France before 1911).— 0.9998 International ampere (v)

International ampere (Germany before 1911).— 0.99968 International ampere (v)

Statampere.—See electrostatic cgs unit

UNITS AND CONVERSION FACTORS (Continued)

Electrical Field Strength [$\epsilon^{-1}m^{1/2}t^{-1}$]; [$\mu^{1/2}m^{1/2}t^{-2}$]

Electrostatic cgs unit of potential per centimeter.—299.796 volts per centimeter (absolute).

Electrostatic cgs unit of potential per inch.—118.05 volts per centimeter (absolute).

Electromagnetic cgs unit of potential per centimeter.— 1.0000×10^{-8} volt per centimeter (absolute).

Electromagnetic cgs unit of potential per inch.— 3.9370×10^{-8} volt per centimeter (absolute).

Volt per inch.—0.39370 volt per centimeter.

Potential [$\epsilon^{-1}m^{1/2}t^{-1}$]; [$\mu^{1/2}m^{1/2}t^{-2}$]

Abvolt.—See electromagnetic cgs unit.

Electromagnetic cgs unit or abvolt.— 3.33560×10^{-11} electrostatic cgs unit or statvolt; 1.0000×10^{-8} volt (absolute).

Electrostatic cgs unit or statvolt.—299.796 volts (absolute); 2.99796×10^{10} electromagnetic cgs units or abvolts.

International volt (a).—Based on the International ohm and ampere; 1.00045 volts (absolute).

International volt (v).—Based on the acceptance of the electromotive force of a Weston cell at 20 °C as 1.0183 International volts; 1.00042 volts (absolute).

International volt (U. S. before 1911).—0.99916 International volt (v).

International volt (England before 1906).—0.99870 International volt (v).

International volt (England 1906-8).—0.99894 International volt (v).

International volt (England 1909-10).—0.99990 International volt (v).

International volt (Germany and France, before 1911).—0.99968 International volt (v).

Statvolts.—See electrostatic cgs unit.

Volt (absolute).—0.0033356 electrostatic cgs unit or statvolts; 0.99955 International volt (a); 0.99958 International volt (v); 1×10^8 electromagnetic cgs units or abvolts.

UNITS AND CONVERSION FACTORS (Continued)

Resistance [$\epsilon^{-1}l^{-1}$]; [μl^{-1}]

Abohm.—See electromagnetic cgs unit.

Board of trade unit (England 1903).—0.9984 International ohm.

Electromagnetic cgs unit or abohm.— 1.11263×10^{-21} electrostatic cgs unit or statohm; 1×10^{-15} megohm; 1.0000×10^{-9} ohm (absolute); 0.001 microhm.

Electrostatic cgs unit or statohm.— 8.98776×10^{11} ohms (absolute); 8.98776×10^{20} electromagnetic cgs units or abohms.

International ohm.—The resistance of a uniform column of mercury at 0°C , 106.300 centimeters long, having a mass of 14.4521 grams; 1.00052 ohms (absolute); 1.0016 board of trade unit (England 1903); 1.0630 Siemens unit.

International ohm (France before 1911).—0.9999 International ohm.

"Legal ohm" of 1884 (England).—0.99718 International ohm.

Megohm.— 1×10^6 ohms.

Microhm.— 1.11263×10^{-18} electrostatic cgs unit or statohm; 1×10^{-12} megohm; 1×10^{-6} ohm; 1000 electromagnetic cgs units or abohms.

Ohm (absolute).— 1.11263×10^{-12} electrostatic cgs unit or statohm; 1×10^{-6} megohm (absolute); 0.99948 International ohm; 1×10^6 microhms (absolute); 1×10^9 electromagnetic cgs units or abohms.

Siemens unit.—0.94073 International ohm.

Statohm.—See electrostatic cgs unit.

Volume Resistivity [$\epsilon^{-1}l$]; [$\mu l^2 t^{-1}$]

Electromagnetic cgs unit (abohm)-centimeter.— 9.9948×10^{-10} International ohm-centimeter; 0.001 microhm-centimeter; 0.0060153 ohm-mil*-foot.

Electrostatic cgs unit-centimeter.— 8.98776×10^{11} International ohm-centimeters.

International annealed copper standard (20°C).—Volume resistivity of annealed copper; 1.7241 microhm-centimeters.

International ohm-centimeter.—1.00052 ohm-centimeters (absolute).

Microhm-centimeter.— 1.0000×10^{-6} ohm-centimeter; 0.3937 microhm-inch; 6.0153 ohm-mil*-foot; 1000 abohm-centimeters.

*The unit thus marked refers to the diameter of a wire of circular cross section.

UNITS AND CONVERSION FACTORS (Continued)

Microhm-inch.—2.5400 microhm-centimeters.

Ohm-centimeter (absolute).—0.99948 International ohm-centimeter; 1×10^6 microhm-centimeters.

Ohm-inch.— 2.5400×10^6 microhm-centimeters.

Ohm-meter-millimeter².—100.0000 microhm-centimeters.

Ohm-meter-millimeter*.—78.540 microhm-centimeters.

Ohm-mil*-foot.—0.16624 microhm-centimeter; 166.24 electromagnetic cgs unit (abohm) centimeters.

Mass Resistivity [$\epsilon^{-1}ml^{-2}t$]; [$\mu ml^{-1}t^{-1}$]

Electromagnetic cgs unit.— 9.9948×10^{-6} International ohm-meter-gram.

Electrostatic cgs unit.— 8.9869×10^{15} International ohm-meter-gram.

International ohm-meter-gram.—1.00052 ohm (absolute)-meter-gram.

Ohm (absolute)-meter-gram.—0.99948 International ohm-meter-gram.

Ohm-centimeter-gram.— $D \dagger$ ohm-centimeter; 1.0000×10^4 ohm-meter-gram.

Ohm-mile-pound.— 1.7513×10^{-4} ohm-meter-gram.

Volume Conductivity [ϵt^{-1}]; [$\mu^{-1}l^{-2}t$]

Electromagnetic cgs unit or abmhos per centimeter cube (ohm⁻¹-centimeter⁻¹).—166.2 mhos per mil* foot; 1000 megmhos per centimeter cube; 1.00052×10^9 International ohm⁻¹-centimeter⁻¹.

Electrostatic cgs unit.— 1.11273×10^{-12} International ohm⁻¹-centimeter⁻¹.

International annealed copper standard (20°C).—0.5800 microhm⁻¹-centimeter⁻¹.

International ohm⁻¹-centimeter⁻¹.—0.99948 ohm⁻¹-centimeter⁻¹ (absolute).

Megmhos per centimeter cube.—0.001 abmhos per centi-

$\dagger D$ represents the density in grams per centimeter cubed.

*The unit thus marked refers to the diameter of a wire of circular cross section.

UNITS AND CONVERSION FACTORS (Continued)

meter cube; 0.1662 mhos per mil* foot; 2.540 megmhos per inch cube; 1 microhm⁻¹-centimeter⁻¹.

Megmhos per inch cube.—0.39370 megmhos per centimeter cube; 1 microhm⁻¹-inch⁻¹.

Mho. centimeter cube.—1 ohm⁻¹-centimeter⁻¹.

Microhm⁻¹-centimeter⁻¹.—1.0000×10⁶ ohm⁻¹-centimeter⁻¹; 1 megmho per centimeter cube.

Microhm⁻¹-inch⁻¹.—0.39370 microhm⁻¹-centimeter⁻¹; 1 megmho per inch cube.

Ohm⁻¹-centimeter⁻¹ (absolute).—1 mho per centimeter cube; 1.00052 International ohm⁻¹-centimeter⁻¹.

Ohm⁻¹-inch⁻¹.—3.9370×10⁻⁷ microhm⁻¹-centimeter⁻¹.

Ohm⁻¹ (meter, millimeter*)⁻¹.—0.012732 microhm⁻¹-centimeter⁻¹.

Ohm⁻¹ (meter, millimeter²)⁻¹.—0.01000 microhm⁻¹-centimeter⁻¹.

Ohm⁻¹ (mil, foot)⁻¹.—6.0153 microhm⁻¹-centimeter⁻¹.

100% conductivity (20°C).—0.5800 microhm⁻¹-centimeter⁻¹.

Mass Conductivity [$\epsilon m^{-1} l^2 t^{-1}$]; [$\mu^{-1} m^{-1} l t$]

x per electromagnetic cgs unit=1.00052×10⁵ x per International ohm-meter-gram.

x per electrostatic cgs unit=1.1127×10⁻¹⁶ x per International ohm-meter-gram.

x per International ohm-meter-gram=0.99948 x per ohm (absolute)-meter-gram.

x per ohm (absolute)-meter-gram=1.00052 x per International ohm-meter-gram.

x per ohm-centimeter-gram=1.0000×10⁻⁴ x per ohm-meter-gram.

x per ohm-mile-pound=0.0057100 x per ohm-meter-gram.

Capacitance [ϵl]; [$\mu^{-1} l^{-1} t^2$]

Electromagnetic cgs unit or abfarad.—1.0000×10⁹ farads (absolute); 1×10¹⁵ microfarads; 8.98776×10²⁰ electrostatic cgs units or statfarads.

*The unit thus marked refers to the diameter of a wire of circular cross section.

UNITS AND CONVERSION FACTORS (Continued)

Electrostatic cgs unit (statfarad or centimeter).— 1.11263×10^{-21} electromagnetic cgs unit or abfarad; 1.11263×10^{-12} farad (absolute); 1.11263×10^{-6} microfarad.

Farad (absolute).— 1×10^{-9} electromagnetic cgs unit or abfarad; 1.00052 International farad; 1×10^6 microfarads; 8.98776×10^{11} electrostatic cgs units or statfarads.

International farad.—0.99948 farad (absolute).

Microfarad.— 1×10^{-15} electromagnetic cgs unit or abfarad; 1×10^{-6} farad; 8.98776×10^6 electrostatic cgs units or statfarads.

Micromicrofarad.— 1×10^{-12} farad.

Statfarad.—See electrostatic cgs unit.

Inductance [$\epsilon^{-1} l^{-1} t^2$]; [μl]

Abhenry.—See electromagnetic cgs unit.

Electromagnetic cgs unit (abhenry or centimeter).— 1.11263×10^{-21} electrostatic cgs unit or stathenry; 1.0000×10^{-9} henry (absolute); 1×10^{-6} millihenry.

Electrostatic cgs unit or stathenry.— 8.98776×10^{11} henry (absolute); 8.98776×10^{14} millihenries; 8.98776×10^{20} abhenries.

Henry (absolute).— 1.11263×10^{-12} electrostatic cgs unit or stathenry; 0.99948 International henry; 1000 millihenries; 1×10^9 electromagnetic cgs units or abhenries.

International henry.—1.00052 henry (absolute).

Millihenry.— 1.11263×10^{-15} stathenry; 0.001 henries; 1×10^6 abhenries.

Stathenry.—See electrostatic cgs unit.

Thermoelectric Units

THERMOELECTRIC POWER [$\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}$]; [$\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2} \theta^{-1}$]

Electromagnetic cgs unit of potential per °C.—0.010000 microvolt per °C (absolute).

Electromagnetic cgs unit of potential per °F.—0.018000 microvolt per °C (absolute).

Electrostatic cgs unit of potential per °C.— 2.9986×10^8 microvolt per °C (absolute).

Electrostatic cgs unit of potential per °F.— 5.3975×10^8 microvolt per °C (absolute).

Microvolt per °F.—1.8000 microvolt per °C.

UNITS AND CONVERSION FACTORS (Continued)

PELTIER COEFFICIENT [$\epsilon^{-1} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}$]; [$\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}$]

Calorie (15°C) per ampere-hour.—0.011625 joule per electromagnetic unit quantity.

Calorie (15°C) per coulomb.—41.850 joules per electromagnetic unit quantity.

Joule per ampere-hour (absolute).— 9.2636×10^{-14} joule per electrostatic unit quantity; 0.0027778 joule per electromagnetic unit quantity.

Joule per coulomb.—10.000 joules per electromagnetic unit quantity.

Joule per electron.— 6.2811×10^{18} joules per electromagnetic unit quantity.

Joule per faraday.— 1.0363×10^{-4} joule per electromagnetic unit quantity.

COEFFICIENT OF THOMSON EFFECT

[$\epsilon^{-1} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1} \theta^{-1}$]; [$\mu^{\frac{1}{2}} m^{\frac{1}{2}} t^{-2} \theta^{-1}$]

Joule per coulomb per °F.—1.8000 joules per coulomb per °C.

Joule per electromagnetic unit quantity per °F.—0.1800 joule per coulomb per °C.

Joule per electron per °C.— 6.2811×10^{18} joules per coulomb per °C.

Joule per electrostatic unit quantity per °C.— 2.9986×10^9 joules per coulomb per °C.

Joule per electrostatic unit quantity per °F.— 5.3975×10^9 joules per coulomb per °C.

Joule per faraday per °C.— 1.0363×10^{-5} joule per coulomb per °C.

Volt per °C.—1.0000 joule per coulomb per °C.

Piezoelectric Constant [$\epsilon^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t$]; [$\mu^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t^2$]

Coulomb per kilogram weight.—3057.7 electrostatic unit quantity per dyne.

Electromagnetic unit quantity per kilogram weight.— 3.0577×10^4 electrostatic unit quantity per dyne.

Electromagnetic unit quantity per pound weight.— 6.7411×10^4 electrostatic unit quantity per dyne.

UNITS AND CONVERSION FACTORS (Continued)

Electron per kilogram weight.— 4.868×10^{-16} electrostatic unit quantity per dyne.

Electrostatic unit quantity per kilogram weight.— 1.0197×10^{-6} electrostatic unit quantity per dyne.

Electrostatic unit quantity per pound weight.— 2.2481×10^{-6} electrostatic unit quantity per dyne.

Faraday per kilogram weight.— 2.9507×10^8 electrostatic unit quantity per dyne.

Flux of Magnetic Induction; Magnetic Flux; Pole Strength

$[\epsilon^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}}]; [\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$

Electromagnetic cgs unit (unit pole).— 4π maxwell (absolute).

Electrostatic cgs unit.— 2.99796×10^{10} maxwells (absolute).

International maxwell (a).—1.00045 maxwells (absolute).

International maxwell (v).—1.00042 maxwells (absolute).

Kilolines.—1000 maxwells.

Line.—1.0000 maxwell (absolute).

Maxwell (absolute).— 3.3356×10^{-11} electrostatic cgs unit; 0.99955 International maxwell (a); 0.99958 International maxwell (v); 1.0000 line.

Megaline.— 1×10^6 maxwells.

Volt-second.— 1×10^8 maxwells.

Weber.—1 volt-second; 1×10^8 maxwells.

Magnetic Field Intensity $[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]; [\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$

Ampere-turn per centimeter.—1.2566 gauss.

Ampere-turn per inch.—0.49474 gauss.

Electromagnetic cgs unit.—1.0000 gauss (absolute).

Electrostatic cgs unit.— 3.33560×10^{-11} gauss (absolute).

Gamma (γ).— 1.0000×10^{-5} gauss.

Gauss (absolute).—0.79580 ampere-turn per centimeter; 1 electromagnetic cgs unit; 1 gilbert per centimeter; 1.00007 International gauss (a); 1.00010 International gauss (v); 2.0213 ampere-turns per inch; 6.452 lines per square inch; 1×10^5 gamma (γ); 2.99796×10^{10} electrostatic cgs units.

UNITS AND CONVERSION FACTORS (Continued)

Gilbert per centimeter.—1.0000 gauss; 2.021 ampere-turns per inch.

International gauss (a).—0.99993 gauss (absolute).

International gauss (v).—0.99990 gauss (absolute).

Lines per square centimeter.—1 gauss.

Lines per square inch.—0.1550 gauss.

Magnetomotive Force; Magnetic Potential

$$[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-2}]; [\mu^{-\frac{1}{2}} m^{\frac{1}{2}} l^{\frac{1}{2}} t^{-1}]$$

Abampere-turn.—10 ampere-turns; 12.566 gilberts.

Ampere-turn.—0.1 abampere-turn; 1.2566 gilberts.

Electromagnetic cgs unit.—1.00000 gilbert (absolute).

Electrostatic cgs unit.— 3.33560×10^{-11} gilbert (absolute).

Gilbert (absolute).—0.07958 abampere-turn; 0.7958 ampere-turn; 1.00007 International gilbert (a); 1.00010 International gilbert (v).

International gilbert (a).—0.99993 gilbert (absolute).

International gilbert (v).—0.99990 gilbert (absolute).

Reluctance $[\epsilon l t^{-2}]; [\mu^{-1} l^{-1}]$

Electromagnetic cgs unit.—1.0000 oersted (absolute).

Electrostatic cgs unit.— 1.1122×10^{-21} oersted (absolute).

International oersted.—0.99948 oersted (absolute).

Oersted (absolute).—1.00052 International oersted.

Magnetic Induction; Intensity of Magnetization

$$[\epsilon^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}}]; [\mu^{\frac{1}{2}} m^{\frac{1}{2}} l^{-\frac{1}{2}} t^{-1}]$$

Electromagnetic cgs unit.—1.00000 maxwell (absolute) per square centimeter.

Electrostatic cgs unit.— 2.9986×10^{10} maxwells (absolute) per square centimeter.

International maxwell per square centimeter (a).—1.00045 maxwells (absolute) per square centimeter.

International maxwell per square centimeter (v).—1.00042 maxwells (absolute) per square centimeter.

UNITS AND CONVERSION FACTORS (Continued)

Line per square centimeter.—1.00000 maxwell per square centimeter.

Line per square inch.—0.15500 maxwell per square centimeter.

Maxwell per square centimeter (absolute).—0.99955 International maxwell per square centimeter (a); 0.99958 International maxwell per square centimeter (v).

Maxwell per square inch.—0.15500 maxwell per square centimeter.

Dielectric Constant; Electrical Inductivity; Magnetic Permeability; Susceptibility.

Electromagnetic cgs unit.— 8.9916×10^{20} electrostatic cgs units.

Foot-pound-second electromagnetic unit.—0.0010764 electromagnetic cgs unit; 9.6784×10^{17} electrostatic cgs units.

Foot-pound-second-electrostatic unit.—1.0000 electrostatic cgs unit.

Magnetic Effects

COEFFICIENT OF LEDUC EFFECT [$\epsilon^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} l^2$]; [$\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}} t$]

x centimeters per ampere-turn = 0.79577 x per gauss.

x centimeters per gilbert = 1.0000 x per gauss.

x per electrostatic cgs unit = 2.9986×10^{10} x per gauss.

x inches per ampere-turn = 2.0213 x per gauss.

COEFFICIENT OF HALL EFFECT [$\epsilon^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} l^3$]; [$\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{\frac{1}{2}}$]

Electrostatic cgs unit.— 2.6962×10^{31} electromagnetic cgs unit.

Volt centimeter per ampere gauss (absolute).— 1.0000×10^9 electromagnetic cgs unit.

Volt inch per ampere gauss (absolute).— 2.5400×10^9 electromagnetic cgs unit.

COEFFICIENT OF ETTINGHAUSEN EFFECT

[$\epsilon^{-1} m^{-1} l^{-1} t^4 \theta$]; [$\mu m^{-1} l t^2 \theta$]

°C centimeter per ampere gauss (absolute).—10.000 °C centimeter per electromagnetic cgs unit.

UNITS AND CONVERSION FACTORS (Continued)

°C centimeter per electrostatic cgs unit.— 8.9916×10^{20} °C centimeter per electromagnetic cgs unit.

°F inch per ampere gauss (absolute).— 45.720 °C centimeter per electromagnetic cgs unit.

COEFFICIENT OF NERNST EFFECT [$\epsilon^{-1} t \theta^{-1}$]; [$\mu l^2 t^{-1} \theta^{-1}$]

Electrostatic cgs unit per °C.— 8.9916×10^{20} electromagnetic cgs unit per °C.

Volt per gauss °C (absolute).— 1.0000×10^8 electromagnetic cgs unit per °C.

Volt per gauss °F (absolute).— 1.8000×10^8 electromagnetic cgs unit per °C.

VERDET'S CONSTANT [$\epsilon^{-\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t^{\frac{1}{2}}$]; [$\mu^{\frac{1}{2}} m^{-\frac{1}{2}} l^{-\frac{1}{2}} t$]

Minute per ampere-turn.— 1.2566 minute per electromagnetic cgs unit.

Minute per gilbert.— 1.0000 minute per electromagnetic cgs unit.

Radian per gilbert.— 3437.7 minute per electromagnetic cgs unit.

RELATIONS OF ELECTRICAL UNITS

1 ohm	= 10^9 electromagnetic	= $1/9 \times 10^{-11}$ electrostatic
1 volt	= 10^8 electromagnetic	= $1/3 \times 10^{-2}$ electrostatic
1 ampere	= 10^{-1} electromagnetic	= 3×10^9 electrostatic
1 coulomb	= 10^{-1} electromagnetic	= 3×10^9 electrostatic
1 farad	= 10^{-9} electromagnetic	= 9×10^{11} electrostatic
1 farad	= 1,000,000 microfarads	
1 henry	= 10^9 electromagnetic	= $1/9 \times 10^{-11}$ electrostatic

VALUE OF THE GAS CONSTANT *R* FOR VARIOUS UNITS

8.3136×10^7 ergs per °C per mole.

1.9864 calories per °C per mole.

Units of pressure	Units of volume.	<i>R</i> per gram molecule.
Atmospheres	Volume at 0° C.	0.003662
Atmospheres	cm ³	82.07
Atmospheres	liters	0.08207
Atmospheres	cubic meters	
Dynes per cm ² [barye]	cm ³	8.3156×10^7
Kilograms per m ² [<i>g</i> = 980.6]	cm ³	8.48×10^5
		<i>R</i> per lb. molecule.
Pounds per sq.in.	cu.in.	18510.
Pounds per sq.in.	cu.ft.	10.71
Atmospheres	cu.in.	1260.
Atmospheres	cu.ft.	0.729

ENERGY AND PRESSURE UNITS

FACTORS FOR CONVERSION OF ENERGY UNITS

CENTIMETERS TO INCHES

*

LENGTHS — CENTIMETERS TO INCHES

0.1 to 100 *Units*

1 centimeter = 0.393700 inches

The values found in the body of the table give, in inches, the lengths indicated in centimeters at the top and side.

METERS TO FEET

*

LENGTHS — METERS TO FEET

From 1 to 1,000 Units

Reduction factor: 1 meter = 3.280833333 feet

The values found in the body of the table give, in feet, the length indicated in meters at the top and side.

KILOMETERS TO MILES

LENGTHS — KILOMETERS TO MILES

From 1 to 1,000 Units

Reduction factor: 1 kilometer = 0.6213699495 mile

Values found in the body of the table give, in miles, the length indicated in kilometers at the top and side.

LITERS TO QUARTS

*

CAPACITIES—LITERS TO LIQUID QUARTS

From 1 to 1,000 Units

Reduction factor: 1 liter = 1.056710 liquid quarts (U. S.)

The values found in the body of the table give, in liquid quarts, the capacities indicated in liters at the top and side.

KILOGRAMS TO POUNDS

*

WEIGHTS — KILOGRAMS TO AVOIRDUPOIS POUNDS

From 1 to 1,000 Units

Reduction factor: 1 kilogram = 2.204622341 avoirdupois pounds

The values found in the body of the table give, in avoirdupois pounds, the weights indicated in kilograms at the top and side.

TO CONVERT DEGREES FAHRENHEIT TO DEGREES CENTIGRADE

Use the first table for one of the digits, and the second table for the others; then add.

Examples: To find the Centigrade equivalent for 35. F.

$$\begin{array}{rcl}
 30 & = & 16.67(2) \quad 30 & = & -1.11(1) \\
 5 & = & -15 \quad (1) \text{ or, } 5 & = & 2.78(2) \\
 \hline
 35 \text{ F} & = & 1.67 \text{ C} \quad 35 \text{ F} & = & 1.67 \text{ C}
 \end{array}$$

To find the C. equivalent for 355. F. and 5445. F.

$$\begin{array}{rcl}
 300 & 148.89(1) \\
 50 & 27.78(2) \text{ or,} \\
 5 & 2.78(2) \\
 \hline
 355 \text{ F} & 179.45 \text{ C} \\
 & 2453
 \end{array}$$

CONVERSION OF THERMOMETER SCALES (Continued)

To CONVERT DEGREES CENTIGRADE TO DEGREES FAHRENHEIT

Use the first table for one digit, and the second table for the others; then add.

Examples: To find the Fahrenheit equivalents for 15.C.; 155.C.; and 5432.C.

10	= 50(1)	18(2)	100	= 212(1)	= 180(2)
5	= 9(2) or, 41(1)	50	= 90(2) or, = 90(2)		
15.C.	= 59.F.	59.F.	5	= 9(2)	41(1)
			155.C.	= 311.F	= 311.F.
5000	= 9000(2)			= 9000(2)	
400	= 720(2)	or,		= 752(1)	
30	= 54(2)			= 54(2)	
2	= 35.6(1)			= 3.6(2)	
<u>5432</u> C.	= <u>9809.6</u> F.			= <u>9809.6</u> F.	

THERMOMETER SCALES

Corrections to Reduce Gas Thermometer Temperature to Thermodynamic Scale.

The values below are corrections to be applied to temperatures determined by the gas thermometer indicated to give temperatures in the thermodynamic centigrade scale for an initial pressure of 100 cm.

Temp. °C	Corrections in °C					
	Constant Volume			Constant Pressure		
	Hydro- gen	Nitro- gen	Helium	Hydro- gen	Nitro- gen	Helium

TEMPERATURES — CENTIGRADE TO FAHRENHEIT

Conversion Table

The values in the body of the table give, in degrees Fahrenheit, the temperatures indicated in degrees Centigrade at the top and side.

1° C. = 1.8° F.

For temperatures below 0° C.

Temp. °C.	0	1	2	3	4	5	6	7	8	9
0	+ 32.0	30.2	28.4	26.6	24.8	23.0	21.2	19.4	17.6	15.8

MOMENT OF INERTIA FOR VARIOUS BODIES

The mass of the body is indicated by m .

MOMENT OF INERTIA

Body	Axis	Moment of inertia
Uniform thin rod	Normal to the length, at one end	$\frac{1^2}{m} \frac{1}{3}$
Uniform thin rod	Normal to the length, at the center	$\frac{1^2}{m} \frac{1}{12}$
Thin rectangular sheet, sides a and b	Through the center parallel to b	$\frac{a^3}{m} \frac{1}{12}$
Thin rectangular sheet, sides a and b	Through the center perpendicular to the sheet	$\frac{a^2+b^2}{m} \frac{1}{12}$
Thin circular sheet of radius r	Normal to the plate through the center	$\frac{r^2}{m} \frac{1}{2}$
Thin circular sheet of radius r	Along any diameter	$\frac{r^2}{m} \frac{1}{4}$
Thin circular ring. Plane figure formed by two concentric circles of radius r_1 and r_2	Through center normal to plane of ring	$\frac{r_1^2+r_2^2}{m} \frac{1}{2}$
Thin circular ring. Plane figure formed by two concentric circles of radius, r_1 and r_2	Any diameter	$\frac{r_1^2+r_2^2}{m} \frac{1}{4}$
Rectangular parallelepiped, edges a , b , and c	Through center perpendicular to face ab , (parallel to edge c)	$\frac{a^2+b^2}{m} \frac{1}{12}$
Sphere, radius r	Any diameter	$\frac{2}{m} \frac{r^2}{5}$
Spherical shell, external radius, r_1 internal, radius r_2	Any diameter	$\frac{2}{m} \frac{(r_1^2-r_2^2)}{5}$

MOMENT OF INERTIA (Continued)

MOMENT OF INERTIA FOR VARIOUS BODIES (Continued)

The mass of the body is indicated by m .

Body	Axis	Moment of inertia
Spherical shell, very thin, mean radius, r	Any diameter	$\frac{2r^2}{3}m$
Right circular cylinder (or disk) of radius r	The longitudinal axis of the solid (central axis perpendicular to circular section of disk)	$\frac{r^2}{2}m$
Right circular cylinder of radius r , length l	Through center perpendicular to the axis of the figure, (transverse diameter)	$m\left(\frac{r^2}{4} + \frac{l^2}{12}\right)$
Hollow circular cylinder, length l , external radius r_1 , internal radius r_2	The longitudinal axis of the figure	$\frac{(r_1^2 + r_2^2)}{2}m$
Thin cylindrical shell, length l , mean radius, r	The longitudinal axis of the figure	mr^2
Hollow circular cylinder, length l , external radius r_1 , internal radius r_2	Transverse diameter	$m\left[\frac{r_1^2 + r_2^2}{4} + \frac{l^2}{12}\right]$
Hollow circular cylinder, length l , very thin, mean radius r	Transverse diameter	$m\left(\frac{r^2}{2} + \frac{l^2}{12}\right)$
Elliptic cylinder, length l , transverse semiaxes a and b	Longitudinal axis	$m\left(\frac{a^2 + b^2}{4}\right)$
Right cone, altitude h , radius of base r	Axis of the figure	$\frac{3}{10}mr^2$
Spheroid of revolution, equatorial radius r	Polar axis	$\frac{2r^2}{5}m$
Ellipsoid, axes $2a$, $2b$, $2c$	Axis $2a$	$\frac{(b^2 + c^2)}{5}m$

RADIO FORMULÆ

A collection of formulæ useful in the computation of inductance, capacitance, and other constants of oscillating circuits. From Radio Instruments and Measurements, Bureau of Standards.

CAPACITANCE

Units.—In the following formula all lengths are expressed in centimeters, areas in square centimeters; the dielectric constant K , is taken as unity for air. Capacitances will be given in micromicrofarads = 10^{-12} farads. The electrostatic unit of capacitance, sometimes called the centimeter = 1.1124 micromicrofarads.

Parallel plate condenser.—If s be the area of one plate; t , the thickness of the dielectric; K , the dielectric constant; and N , the number of plates,—the capacitance

$$C = 0.0885 K \frac{(N - 1)s}{t}.$$

Variable condenser, semicircular plates.—Where N is the total number of parallel plates; r_1 the outer, and r_2 the inner radius of the plates; t , the thickness of the dielectric, and K the dielectric constant,—the maximum capacitance is given by

$$C = 0.1390K \frac{(N - 1)(r_1^2 - r_2^2)}{t}.$$

Isolated thin circular disk. — If d is the diameter of the disk

$$C = 0.354d.$$

Isolated sphere. — If d is the diameter of the sphere

$$C = 0.556d.$$

Two concentric spheres. — If r_1 is the radius of the outer sphere; r_2 , that of the inner sphere; K , the dielectric constant of the material between the spheres,

$$C = 1.112K \frac{r_1 r_2}{r_1 - r_2}$$

Two coaxial cylinders. — If r_1 is the radius of the outer cylinder; r_2 , that of the inner; l , the length of the cylinders; K , the dielectric constant,

$$C = K \frac{0.2416 l}{\log_{10} \frac{r_1}{r_2}}.$$

Single long wire parallel to the ground. — For a wire of length l ; diameter, d ; suspended at a height h above the ground, where the diameter is small compared with the length,

RADIO FORMULAE (Continued)

$$\text{For } \frac{4h}{l} = \text{or} < 1 \quad C = \frac{0.2416 l}{\log_{10} \frac{4h}{d} - k_1}$$

$$\text{For } \frac{l}{4h} = \text{or} < 1 \quad C = \frac{0.2416 l}{\log_{10} \frac{2l}{d} - k_2}$$

In which,

$$k_1 = \log_{10} \left[\frac{1 + \sqrt{1 + \left(\frac{4h}{l}\right)^2}}{2} \right] \quad k_2 = \log_{10} \left[\frac{l}{4h} + \sqrt{1 + \left(\frac{l}{4h}\right)^2} \right]$$

the values of which may be found in a table at the end of this section.

Vertical wire. — For a wire of length l , relatively high above the ground; of diameter d , the approximate capacitance is as follows,

$$C = \frac{0.2416 l}{\log_{10} \frac{2l}{d}}$$

Two horizontal parallel wires at the same height. — If d is the diameter of each wire; l , the length of each; h , the height above the ground; D , the distance between wires, — where d and D are small compared to l ,

$$C = \frac{0.1208 l}{\log_{10} \frac{2D}{d} - \frac{D^2}{8h^2}}$$

Two parallel horizontal wires, one above the other. — Use the preceding formula for parallel wires at the same height, substituting the mean height for h .

Two parallel wires joined together, both at the same height. — Let l be the length of each wire; D , the distance between centers; h , the height above the ground; d_1 the diameter of cross section of the wire. If d^2 and D^2 are small compared with l^2 and $4h^2$ respectively

$$\text{For } \frac{4h}{l} = \text{or} < 1 \quad C = \frac{0.4831 l}{\log_{10} \frac{4h}{d} + \log_{10} \frac{2h}{D} - 2k_1}$$

$$\text{For } \frac{l}{4h} = \text{or} < 1 \quad C = \frac{0.4831 l}{\log_{10} \frac{2l}{d} + \log_{10} \frac{l}{D} - 2k_2}$$

k_1 and k_2 have the same significance as above and may be found from the tables at the end of the section.

RADIO FORMULAE (Continued)

Several wires in parallel.—If n parallel wires are joined together; D , the spacing between the wires; d , the diameter of the wire; h , the height above the ground; l , the length of the group,—the approximate capacitance is,

$$C = \frac{1.112 l}{\frac{p_{11} + (n-1)p_{12}}{n} - k}$$

p_{11} and p_{12} may be computed from the following:

For $\frac{4h}{l} = \text{or} < 1$ $p_{11} = 4.605 \left[\log_{10} \frac{4h}{d} - k_1 \right]$

$p_{12} = 4.605 \left[\log_{10} \frac{2h}{D} - k_1 \right]$

For $\frac{l}{4h} = \text{or} < 1$ $p_{11} = 4.605 \left[\log_{10} \frac{2l}{d} - k_2 \right]$

$p_{12} = 4.605 \left[\log_{10} \frac{l}{D} - k_2 \right]$

Values of k , k_1 , k_2 may be found in the following table.

TABLE 1

$\frac{4h}{l}$	k_1	$\frac{l}{4h}$	k_2	n	k	n	k
0	0	0	0	2	0	11	2.22

1.0	.082	1.0	.383				

INDUCTANCE

Units.—In the following formulæ all lengths are expressed in centimeters. The inductance calculated will be in microhenries = 10^{-6} henry.

Long straight round wire.—If l is the length; d , the diameter of cross section; μ the permeability of the material,—the inductance at zero or low frequency is,

$$L = 0.002 l \left[2.303 \log_{10} \frac{4l}{d} - 1 + \frac{\mu}{4} \right]$$

RADIO FORMULAE (Continued)

For all except iron wire $\mu = 1$ and the last term becomes 0.25.

For wires whose length is less than about 1000 times the diameter the term $+\frac{d}{2l}$ should be added inside the brackets.

For any frequency:

$$L = 0.002 l \left[2.303 \log_{10} \frac{4l}{d} - 1 + \mu \delta \right]$$

where δ is a quantity given in Table 2 below as a function of x .
 x is to be computed from the relation

$$x = 0.1405 d \sqrt{\frac{\mu f}{\rho}}$$

where d and μ are as above; f , the frequency and ρ the resistivity of the material of the wire expressed in microhm-centimeters. (See Properties of Metallic Conductors.)

For copper at 20° C.

$$x = 0.1071 d \sqrt{f}.$$

For wires other than iron, whose length is 100,000 times the diameter the inductance at infinite frequency is about 2% less than at zero frequency.

TABLE 2

Values of δ for computing inductance at any frequency.

x	δ	x	δ
0	0.250	12	0.059
0.5	.250	14	.050
1.0	.249	16	.044

8.0	.088	100	.007
9.0	.078	∞	.000
10.0	.070		

RADIO FORMULAE (Continued)

Two parallel round wires, return circuit.—If l is the length of each wire; d , the diameter; D , the distance between centers of wires; μ the permeability,—the inductance for any frequency is

$$L = 0.004 l \left[2.303 \log_{10} \frac{2D}{d} - \frac{D}{l} + \mu \delta \right]$$

where δ is a quantity to be obtained from the table above as a function of x which is to be computed as explained for the previous formula.

For copper and at low frequency the term δ becomes 0.25.

Square of round wire.—If a is the length of the side of the square; d , the diameter of the wire; μ the permeability, the inductance for any frequency is,

$$L = 0.008a \left[2.303 \log_{10} \frac{2a}{d} + \frac{d}{2a} - 0.774 + \mu \delta \right]$$

where δ is obtained as above. For low frequency and for wires other than iron δ becomes 0.25; for infinite frequency the value is zero.

Grounded horizontal wire, the Earth acting as return circuit. If l is the length of wire; h , the height above the ground; d , the diameter of the wire; μ the permeability and δ the frequency constant (see table 2), the inductance,—where d is small compared with l ,—is given as follows:

$$\text{For } \frac{2h}{l} = \text{or } < 1 \quad L = 0.002 l \left[2.3026 \log_{10} \frac{4h}{d} - P + \mu \delta \right]$$

$$\text{For } \frac{l}{2h} = \text{or } < 1 \quad L = 0.002 l \left[2.3026 \log_{10} \frac{4l}{d} - Q + \mu \delta \right]$$

P and Q may be found in the following table.

TABLE 3

$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q	$\frac{2h}{l}$	P	$\frac{l}{2h}$	Q

The mutual inductance of the case above may be expressed.

RADIO FORMULAE (Continued)

$$\text{For } \frac{2h}{l} = \text{or } < 1 \quad M = 0.002 l \left[2.3026 \log_{10} \frac{2h}{D} - P + \frac{D}{l} \right]$$

$$\text{For } \frac{l}{2h} = \text{or } < 1 \quad M = 0.002 l \left[2.3026 \log_{10} \frac{2l}{D} - Q + \frac{D}{l} \right]$$

The values of P and Q are found in the table above.

Grounded wires in parallel. — Compute by the above formulae the inductance L_1 per unit length of a single wire and the mutual inductance M_1 per unit length of two adjacent wires, using the actual length in determining the ratios $\frac{2h}{l}$,

$\frac{2l}{d}$ etc. Then the inductance of n parallel wires will be,

$$L = l \left[\frac{L_1 + (n-1)M_1}{n} - 0.001k \right]$$

where k is a function of n found in Table 1 under capacity formulae.

Circular ring of round wire. — If a is the mean radius of the ring; d , the diameter of the wire, the inductance at any frequency is

$$L = 0.01257a \left[2.303 \log_{10} \frac{16a}{d} - 2 + \mu\delta \right]$$

where δ is determined from the table above.

Circular coil of circular cross section. — For a coil of n fine wires wound with mean radius of the turns a , the cross section of whose winding is a circle of diameter d , the inductance at low frequency, for wire other than iron, neglecting insulation space is,

$$L = 0.01257an^2 \left[2.303 \log_{10} \frac{16a}{d} - 1.75 \right]$$

Torus with a single layer transverse winding, — a circular solenoid of circular cross section. If r is the distance from the center of the torus to the center of the transverse section; a , the radius of the turns of the winding; n , the number of turns, the inductance at low frequency is

$$L = 0.01257n^2 \left[r - \sqrt{r^2 - a^2} \right]$$

Solenoid, single layer. If n is the number of turns; a the radius of the coil; b , the length, the approximate inductance at any frequency is,

$$L = \frac{0.03948a^2n^2}{b} K$$

where K is a function of $\frac{2a}{b}$ given in the table below.

Long multiple layer solenoid. — The inductance is given approximately by,

$$L = L_1 - \frac{0.01257n^2ac}{b}(0.693 + B_s)$$

RADIO FORMULAE (Continued)

where L_1 is the inductance calculated from the formula for a single layer solenoid, n being the number of turns of the winding; a , the radius of the coil measured from the axis to the center of the cross section of the winding; b , the length of the coil; c , the radial depth of the winding; B_s a correction given in table below as a function of b/c .

TABLE 5

12	.2888	27	.3190
13	.2927	28	.3200
14	.2961	29	.3209
15	.2991	30	.3218

Square coil of rectangular cross section. — If a be the side of the square measured to the center of the rectangular section which has sides b and c and if n be the number of turns,

$$L = 0.008an^2 \left[2.303 \log_{10} \frac{a}{b+c} + 0.2235 \frac{b+c}{a} + 0.726 \right]$$

If the cross section is a square $b = c$ and the expression becomes

$$L = 0.008an^2 \left[2.303 \log_{10} \frac{a}{b} + 0.447 \frac{b}{a} + 0.033 \right]$$

MUTUAL INDUCTANCE

Two parallel wires. — If l be the length of each wire; D , the distance between, the inductance is

$$M = 0.002l \left[2.303 \log_{10} \frac{2l}{D} - 1 + \frac{D}{l} \right]$$

Coaxial solenoids, single layer coils, not concentric. If a is the radius of the smaller coil; A , the radius of the larger; n_1 and n_2 the number of turns on the smaller and larger coil respectively; $2l$ the length of the smaller coil; $2x$, the length of

RADIO FORMULAE (Continued)

the larger; D , the distance between the centers of the coils measured along the common axis,

$$M = 0.009870 \frac{a^2 A^2 n_1 n_2}{2x \cdot 2l} \left[K_1 k_1 + K_3 k_3 + K_5 k_5 \right]$$

where

$$K_1 = \frac{2}{A^2} \left(\frac{x_2}{r_2} - \frac{x_1}{r_1} \right) \quad k_1 = 2l$$

$$K_3 = \frac{1}{2} \left(\frac{x_1}{r_1^5} - \frac{x_2}{r_2^5} \right) \quad k_3 = a^2 l \left(3 - 4 \frac{l^2}{a^2} \right)$$

$$K_5 = -\frac{A^2}{8} \left[\frac{x_1}{r_1^9} \left(3 - 4 \frac{x_1^2}{A^2} \right) - \frac{x_2}{r_2^9} \left(3 - 4 \frac{x_2^2}{A^2} \right) \right]$$

$$k_5 = a^4 l \left(\frac{5}{2} - 10 \frac{l^2}{a^2} + 4 \frac{l^4}{a^4} \right)$$

where

$$x_1 = D - x \quad r_1 = \sqrt{x_1^2 + A^2}$$

$$x_2 = D + x \quad r_2 = \sqrt{x_2^2 + A^2}$$

The above is most accurate for short coils with relatively great distance between.

Coaxial, concentric solenoids, outer coil the longer. If a be the radius of the smaller coil; A , that of the larger; $2l$, the length of the inner coil; $2x$, the length of the outer; n_1 and n_2 the number of turns on the inner and outer coil respectively,

$$M = \frac{0.01974 a^2 n_1 n_2}{g} \left[1 + \frac{A^2 a^2}{8g^4} \left(3 - 4 \frac{l^2}{a^2} \right) \right]$$

where $g = \sqrt{x^2 + A^2}$.

Coaxial, concentric solenoids, outer coil the shorter. Assuming the symbols as before except

$$g = \sqrt{l^2 + A^2}$$

$$M = 0.01974 \frac{a^2 n_1 n_2}{g} \left[1 + \frac{A^2 a^2}{8g^4} \left(3 - 4 \frac{x^2}{a^2} \right) \right]$$

HIGH FREQUENCY RESISTANCE

Cylindrical straight wires.—The ratio R/R_0 of the high frequency resistance to the resistance at low frequency may be found from the table below, by calculating first the value of x from the relation,

$$x = \pi d \sqrt{\frac{2\mu f}{\rho}} \sqrt{\frac{1}{1000}}$$

where d is the diameter of the wire in centimeters; μ , the magnetic permeability; f , the frequency; ρ , the resistivity in microhm-centimeters.

RADIO FORMULAE (Continued)

For copper wire $x = 10da$ where a has a value given by $a = 0.01071$. The value of a for various frequencies may be found in the second of the two tables below. The above method gives the high-frequency resistance of simple circuits of any shape where the length is great compared with the diameter of the wire and the different portions of the circuit are not close to each other.

TABLE 6

WAVE LENGTH

The wave length in meters is given by the following expression when L , the inductance, is in microhenries and C , the capacitance, is in microfarads. The resistance is assumed negligible.

$$\lambda = 1884\sqrt{LC}$$

VALUES OF "L C"

The following table gives values of the product of the inductance and capacitance (L C) in microhenries and microfarads for wave lengths from 1 to 20,000 meters, and the corresponding frequencies in kilocycles.

Wave length, meters	Frequency, kilocycles	L C Microhenries Microfarads	Wave length, meters	Frequency, kilocycles	L C Microhenries Microfarads

VALUES OF W AND 1/W²

Computed by C. W. Winkler,
submitted by J. Johnsen

The values for w were computed to 9 significant figures and rounded to 8. These values, in the range 100 to 1000 kc, were obtained by adding the common difference $2\pi \times 10^{-2}$ for intervals of 1 kc. Every fifth entry was checked by adding $\pi \times 10^{-1}$ to the previous key entry. Values from 1000 to 2000 kc were obtained in the same way except the common difference here is $2\pi \times 10^{-3}$. The values for $1/w^2$ were obtained by taking the reciprocal of the squared values of w and were checked with some previously computed tables.

EXTENSION OF TABLES

Let the tabulated value for w be M . The range of the tables may be extended as follows.

Frequency	w	$1/w^2$
5 cycles	$M \times 10^{-5}$	$M \times 10^{10}$
50 cycles	$M \times 10^{-4}$	$M \times 10^8$
500 cycles	$M \times 10^{-3}$	$M \times 10^6$
5 kc	$M \times 10^{-2}$	$M \times 10^4$
50 kc	$M \times 10^{-1}$	$M \times 10^2$
500 kc	M	M
5 mc	$M \times 10$	$M \times 10^{-2}$
50 mc	$M \times 10^2$	$M \times 10^{-4}$
500 mc	$M \times 10^3$	$M \times 10^{-6}$
5000 mc	$M \times 10^4$	$M \times 10^{-8}$

CHARACTERISTICS OF

Compiled by

Since the exact operating characteristics may vary considerably depending upon the use information should be consulted for further details.

Abbreviations

A.C., alternating current	D.C., direct current
A.F., audio frequency	Det., detector
Amp., amperes, amplifier, amplification	Diss., dissipation
B, bayonet	Fil., filament
Coat., coated	Heat., heater
Cond., conductance	H. F., high frequency
Conv., converter, conversion	m, milli-
Cur., current	M, medium

RECEIVING

Metal tubes are designated by the letter M in front of the tube number. The type of connections are indicated by diagrams with the corresponding numbers, following the tables.

Type No.	Description and use	Base	Cathode			Plate potential volts	Plate current ma	Screen potential volts

RECEIVING

Type No.	Description and use	Base	Cathode			Plate potential volts	Plate current ma	Screen potential volts
			Type ¹	Potential volts	Current amp.			
KR-20	Two grid det		Heat.	2 5	1 00	250	3 5	
KR-22	Two grid det		Heat.	6 3	0 40	250	3 5	
KR-25	Output pentode. . . .		Heat.	2 5	1 75	250	34 0	250

¹ Either A.C. or D.C. may be used on filament or heater, except as specifically noted. For use of D.C. on A.C. filament types, decrease stated grid volts by $\frac{1}{2}$ (approx.) of filament voltage.

² For grid leak detection, plate volts 45, grid return to + filament or to cathode.

³ Also available in octal base, glass bulb type. Characteristics data for the glass type, except for some difference in capacitance value, are the same as for the type listed. In certain cases where socket connection to shield on metal type tube is indicated there is no connection on the glass type tube.

⁴ Grids #3 and #5 are screen. Grid #4 is signal input control grid.

⁵ Supply voltage applied through 20000 ohm voltage dropping resistor.

⁶ For grid of following tube.

⁷ Subscript 1 on class of amplifier service (as AB₁) indicates that grid current does not flow during any part of input cycle. Subscript 2 on class of amplifier service (as AB₂) indicates that grid current flows during some part of the input cycle.

⁸ Power output is for two tubes at stated plate-to-plate load.

⁹ Triode plate supply voltage and maximum target voltage, minimum target voltage = 90 volts.

¹⁰ Grid #2 tied to plate.

¹¹ Cathode current, 0.43 ma.

¹² Grids #2 and #4 are screen. Grid #1 is signal input control grid.

¹³ Both grids connected together; likewise, both plates.

¹⁴ Applied through plate resistor of 250000 ohms.

¹⁵ Applied through plate resistor of 100000 ohms.

¹⁶ Applied through plate resistor of 150000 ohms.

¹⁷ Applied through 200000 ohm plate resistor.

¹⁸ For signal input control grid (#1): control grid #3 bias, -3 volts.

¹⁹ Applied through plate resistor of 250000 ohms or 500 henry choke shunted by 0.25 megohm resistor.

²⁰ Grids #1 and #2 tied together.

²¹ Requires different socket from small 7-pln.

²² Grid #1 is control grid. Grids #2 and #3 tied to plate.

²³ Grid #1 is control grid. Grid #2 is screen. Grid #3 tied to cathode.

²⁴ Grids #1 and #2 connected together. Grid #3 tied to plate.

²⁵ Cathode current, 0.65 ma.

²⁶ Tubes number 303-A and 309-A, often used as receiving tubes, are listed under *Telephone and Industrial Tubes*.

¹ Double grid.

² All metal.

BASE CONNECTIONS

Looking at Bottom of Tube

BP, bayonet pin	H, heater	P, plate
F, filament	K, cathode	PBF, beam forming plates
G, grid	NC, no connection	TA, target

Alphabetical subscripts D, P and T indicate, respectively, diode unit, pentode unit, and triode unit in multi-unit types.

Numerical subscripts are used (1) in multi-grid types to indicate relative position of grids to cathode or filament, and (2) in multi-unit types to differentiate between two identical electrodes which would otherwise have the same designation.

LABORATORY ARTS AND RECIPES

Many of the following recipes have been contributed by users of the Handbook. To those who have cooperated in this way we extend our grateful acknowledgment.

BLUING STEEL AND IRON

The metal is cleaned with a potassium bichromate-sulfuric acid mixture, then washed with ammonium hydroxide and rubbed dry. Apply ammonium polysulfide until the desired depth of color is obtained, allowing the object to dry after each application and rubbing briskly with soft clean cloth. The result is a deep blue which may be made very nearly black by repeated applications. Rubbing with boiled linseed oil will deepen this color more. The finish thus obtained is very resistant to oxidation.

CEMENTS AND ADHESIVES

Acid Proof Cement

1

A handy acid resisting cement can be made by mixing sodium silicate and asbestos powder to the consistency of a thin paste. If allowed to dry for a day, the resulting cement will resist the strongest acids.

2

Barium sulfate 4 parts, water glass 3 parts, asbestos 1 part. Sodium fluosilicate or sodium fluoborate is advised in addition when the cement is used on glass.

Aquarium Cement

1

Glazier's putty	10 lb.
Litharge	1 lb.
Red lead	1 lb.
Asphaltum.	4 oz. fl.

Mix with boiled linseed oil to the proper consistency. Lamp black may be added to give a gray color.

2

Red lead	3 parts
Litharge	7 parts
Fine sand.	10 parts
Powdered rosin	1 part

Add sufficient spar varnish to give the proper consistency.

Cement for Cellophane

The following is said to be a very satisfactory glue or cement for cellophane:

Gum acacia (gum arabic)	..	16	5 parts by weight
Glycerin	29	5 parts by weight
Water	49	5 parts by weight
Formaldehyde (40 %)	4	5 parts by weight

ARTS AND RECIPES (Continued)

Cupric Oxide Cement

For a strong adhesive cement for attaching metal articles to each other or for cementing glass, a paste of cupric oxide and phosphoric acid is very satisfactory. The cement is adhesive, strong and sets quite rapidly.

De Khotinsky Cement

1

About 70 grams of light brown orange shellac is added in small amounts to 30 grams of heated pine tar. The mixture is stirred at frequent intervals for a period of two hours (or four hours) and maintained at a temperature of 130° C. or slightly lower. (The longer heating period gives a cement that is suitable for high vacuum work.) The product may be tested at intervals by dropping some of it into cold water and then subjecting it to bending pressure. Under such treatment, the product should not bend but break with a conchoidal fracture.

If a harder product is desired, 85 grams of light brown shellac may be mixed and heated with 30 grams of pine tar.

The finished product, while still warm, may be spread on a stone slab or a smooth surface and rolled into small sticks.

This sealing cement will be found useful whenever two pieces of apparatus are to be cemented together. The cementing is effected by warming the surfaces and applying melted cement. The removal of the cement may be facilitated by softening it with alcohol.

2

A handy water-proof laboratory cement of the type "Kotinsky Cement" is made from:

Dry yellow or orange shellac	3 parts by weight
Pine tar	1 part by weight

Place the shellac in a double boiler using water in the outer member. Add the pine tar and permit to digest with occasional stirring until the mass is homogeneous; this will take about five hours. Pull out like taffy and make into sticks. The cement can be made harder or softer by varying the amount of tar.

General Hints

Glues of all kinds are useful for wood, leather, paper and glass, where the joints are not required to be waterproof.

For waterproof joints of nearly all substances, including metals, shellac may be used. Flakes of solid shellac may be used with heat or it may be used as a solution in alcohol.

Kotinsky cement, Chatterton's compound and other resinous cements are used for similar purposes and in the same way as solid shellac. Glass cells made up with compounds of this nature may be made impervious to alcohol by painting over the joints with a rubber cement made by melting up small pieces of rubber tubing and adding carbon disulfide to make a thin syrup.

For celluloid a cement made by dissolving celluloid shavings in acetone is recommended.

Brass fittings are usually cemented on glass tubing with sealing wax. The glass tube should be wound with thread or twine to secure a close fit. The glass and the brass fitting should be warmed

ARTS AND RECIPES (Continued)

slightly above the melting point of wax. (Thick or pressed glass should be warmed slowly.) Wax may be applied to both parts and the thread well saturated with the melted wax. Enough should be used to insure filling the space completely. Join the parts while the wax is very soft and clamp in position until it is thoroughly cold.

For optical purposes, cementing glass, etc., Canada balsam is universally employed, and makes a permanent and nearly invisible joint.

Laboratory Adhesive

Nitrated cotton (5-6 sec.)..... 30 grams

Make up a solution of:

Di methyl ketone (acetone)	100	milliliters (c.c.)
Amyl acetate....	45	milliliters (c.c.)
Butyl acetate....	15	milliliters (c.c.)
Ethyl acetate....	15	milliliters (c.c.)
*Ethyl abietate.	1.5	milliliters (c.c.)

* $\frac{1}{2}$ above of castor oil is a substitute.

Using the latter solution as solvent, add the nitrated cotton until the solution is of the consistency of syrup. Dissolving the cotton takes about two hours. If the mixture is too thick, a little more of the above solvent, which should be kept on hand, is added.

The above solution should not blush when applied to any surface. It should dry quickly into a tough film which is stable over a long period owing to the plasticizer, ethyl abietate.

The above is useful for cementing cross hairs, coating labels, sealing rubber to tubing, etc.

In case a more flexible film is desired the amount of the plasticizer may be doubled. In case of blushing increase amyl acetate.

Litharge Cement for Joining Metal to Glass

In the preparation of tanks with glass sides or bottom, it is desired to make these water tight by cementing the glass to the iron frame or to repair the leaks that may occur.

Litharge (PbO)	260	grams
Glycerin solution (glycerin 2 parts, water 1 part)	100	milliliters (c.c.)

Place the litharge in a mortar, add the diluted glycerin slowly while grinding. Mix thoroughly by grinding a short time. Heat will be evolved and the mixture will begin to set. While still soft, pour it into place and by means of a spatula work it into position as in the case of putty. Allow to stand for a day when it will be thoroughly hard.

If desired, it may be covered with a layer of white lead or aluminum paint.

Mucilage or Paste

Gum arabic (gum acacia).....	1	part
Rice starch	1	part
Sugar	4	parts
Water	10	parts

ARTS AND RECIPES (Continued)

Warm the gum arabic with some of the water until it has a jelly-like consistency. Mix the sugar and starch with enough water to make a smooth paste. Combine these two mixtures, and boil until the starch is clear.

Shellac Cement

DE KHOTINSKY TYPE

(Benzene Resistant)

Note: Most recipes for de Khotinsky cement call for pine tar, to the amount of 40 to 50 %, as the material with which shellac is plasticized for the application in question. Recent investigation indicates that pine tar is inferior to the creosote plasticizer recommended below.

Prepare the plasticizer by mixing one volume of terpeneol with three volumes of beechwood creosote (alkali-soluble). Coal-tar creosote, not completely alkali-soluble, will not do.

Heat from 12 to 25 grams of the plasticizer to about 130° C. With constant stirring add 85 grams of shellac as fast as it dissolves smoothly. When the mixture is homogeneous, allow to cool until it will barely flow from the vessel, and pour into molds which have been lightly but completely covered with petrolatum. The use of only 12 grams of plasticizer gives a very hard cement; 25 grams gives a very soft product.

Shellac-Wax Cement

(Benzene Soluble)

Rosin	35 grams
Shellac . . .	20 grams
Beeswax	20 grams
Talc, fibrous (asbestine pulp)	0 to 30 grams

Melt the rosin in a large (6 or 8 in.) hemispherical iron pan, add the shellac and beeswax with stirring. Heat strongly with a large Bunsen flame so that the temperature reaches 360° C. in six minutes; then extinguish the burner. When the temperature has reached about 275° C., add the talc, if any is to be used. Finally when the mixture is so viscous that it will barely pour from the pan, pour into metal molds which have previously been very thoroughly scoured with washing powder and thickly coated with aqueous dextrine paste which is still wet. The talc gives a more viscous cement at temperatures just above the melting point.

Transparent Sealing Resin

A transparent resin which adheres well to glass, quartz and metals may be made by heating together equimolal quantities of phthalic anhydride and ethylene glycol for 24 hours at 200° C. The resin softens at 95°–110° C. It is unaffected by water but slowly dissolved by organic solvents and is particularly useful for high-vacuum seals.

Vacuum Wax

Wax for coating joints which may be used for ordinary vacuum distillations etc. where the temperature does not get too high:

Melt together equal parts (by weight) of beeswax and rosin. The product is pliable and easily removed from apparatus by simply using hot water.

ARTS AND RECIPES (Continued)

CLEANING COMPOUNDS AND METHODS

Alcoholic Sodium Hydroxide Solution for Cleaning

Dissolve 120 grams sodium hydroxide in 120 c.c. water. Dilute to 1 liter with 95 % alcohol.

Burette Cleaning Assembly

A burette cleaning assembly may consist of a 300 c.c. beaker of cleaning solution mounted on a ring stand having a $7 \times 9''$ base. Higher on the stand is a clamp for engaging the burette to be cleaned and still higher a mounting of $\frac{3}{8}''$ rubber tubing connected with an aspirator. The cleaning solution is heated, the burette placed with its top dipping into the cleaning solution while the aspirator tubing is slipped on the delivery end of the burette. When hot cleaning liquid has been aspirated to near the glass stopcock or pinch-cock, the cock is closed and the aspirator tubing slipped off, leaving the cleaning solution in the burette. After a minute or so, the cock is opened and the cleaning solution is allowed to run out of the burette, which will leave a uniform film if the burette is clean. The burette is transferred to a sink and after cooling is rinsed with tap and distilled water. By this means 50 burettes per hour may be made ready for use.

Brown Stains on Burettes

Brown stains left on the inside of burettes used for KMnO_4 solutions may be removed by filling the burette with FeSO_4 solution after which the liquid is removed and completely washed out. A convenient, ready for use, solution of FeSO_4 may be made by placing small nails in a dilute H_2SO_4 solution, keeping the flask closed except for a hydrogen vent, thus preventing oxidation of the iron.

Cleaning Engler Flasks

To thoroughly remove all of the carbonaceous deposit baked in the bottom of an Engler flask from gasoline distillation, place 2 or 3 grams of commercial Na_2SO_4 in the flask to be cleaned; apply heat directly to the flask from a Bunsen burner. Heat until all the carbon residue has been loosened. Cool, rinse and drain.

Cleaning Fermentation Tubes and Other Glassware

Fermentation tubes (used in water testing) and other glassware difficult to clean in the ordinary way, may be cleaned as follows:

Moisten the inside of the tube with ethyl alcohol. Pour off the excess alcohol, leaving not to exceed two c.c. of the liquid in the tube. Add ten c.c. of concentrated nitric acid and let it stand. Soon a vigorous reaction takes place with the elimination of large quantities of nitrogen dioxide. When the reaction stops, wash with water. As some nitric acid may be blown out of the tube, it should be placed in a sink (preferably in a hood) until the reaction ceases. Do not close the tube.

Cleaning Fluid

An excellent solution for cleaning grease stains from cloth or leather consists of the following:

CCl_4	80 %
Ligroin	16 %
Amyl alcohol (ter.)	4 %

ARTS AND RECIPES (Continued)

Cleaning Mercury

Mercury may be cleaned sufficiently for many laboratory purposes without distilling. Allow the mercury to fall in a fine spray into a quantity of dilute nitric acid, 25 parts of acid to 75 parts of distilled water. After being passed through the acid one or more times it should be passed through distilled water and dried. Most of the water may be removed with a clean filter, and the mercury heated in a porcelain dish to about 110° C. To produce the spray the stem of a glass funnel may be drawn down so as to leave only a small opening for the escape of mercury or a glass tube with a capillary point attached to a funnel with a tightly fitting rubber tube.

A three- to four-foot length of one-inch glass tube closed at one end and supported in a vertical position may be used to contain the acid solution. If a small glass tube be fused into the lower closed end of the large tube, and bent so as to stand up for a distance a little greater than $1/13.6$ the column of acid solution in the large tube, a U-tube is formed in which a short column of mercury supports the long column of acid solution.

The end of the small tube should be bent over at the top so as to facilitate the delivery of the mercury and a short piece of clean rubber tubing with a pinch-cock put on at the start; as soon as mercury enough has collected in the bottom of the tube the pinch-cock may be opened. The mercury will rise nearly or quite to the top of the small tube, and as the quantity increases will be delivered from the small tube as fast as it falls in the spray.

The reversed end of the small tube should be short to avoid forming a siphon, which would completely empty the apparatus.

An efficient procedure, especially if the mercury is greasy, consists in spraying the mercury by means of the above apparatus, first, through a dilute solution (10 %) of potassium hydroxide, then through dilute nitric acid (10-15 %) and finally through distilled water.

Cleaning Optical Surfaces for Silvering

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission)

Probably the most important part of the silvering process is the proper cleaning of the surface to be silvered.

The surface is thoroughly cleaned of grease or other organic matter by the usual methods, using alcohol or chromic acid. Then it should be carefully cleansed with strong nitric acid, the whole surface being firmly rubbed with clean cotton tied to a rod of wood or glass. Care should be taken not to injure the surface. Rinse with water, and then wash the surface thoroughly with a strong solution of caustic potash, rubbing with a cotton brush as before. Finally, rinse with distilled water, and keep the surface wet until it is placed in the silvering solution. If the distilled water wets the whole surface uniformly the cleaning may be sufficient; if it does not wet uniformly, the operations must be repeated. The fingers should not touch the edges of the glass during the latter cleaning operations, as a layer of organic matter is apt to spread over the surface and render the silvering uneven.

Dr. Brashear recommends that the surface, after the washings described above, be rubbed with prepared chalk on a cotton wad until it is thoroughly dry and clean. It may then be put into the silvering solution at one's convenience.

ARTS AND RECIPES (Continued)

Cleaning Solution for Glass

35 c.c. saturated sodium dichromate (technical)
1 liter conc. sulfuric acid poured into the dichromate solution

Avoid contact with the flesh or clothing.

Cleaning Solution

Trisodium phosphate..... 2 oz.
Sodium oleate 1 oz.
Distilled water.. . . . 1 pint

Soak apparatus in the warm solution 10-15 minutes, then brush with a stiff brush.

Iodine Stains

Iodine stains can readily be removed from clothing by washing the stain with a 10 % solution of sodium thiosulfate ("hypo") in water.

Paint Brush Cleaner

(1) Kerosene 2 pints
Oleic acid 1 pint
(2) Aqueous ammonia (conc.) $\frac{1}{2}$ pint
Denatured alcohol $\frac{1}{4}$ pint

Stir (2) into (1) until uniform. To clean brushes, place in the mixture over night. Wash thoroughly with warm water.

Removal of Carbonaceous Matter

A 10-15 % solution of NaOH or KOH removes carbon etc. quickly. Rinse well with acid and H_2O .

Removing Carbon Deposits from Flasks

First rinse flask with acetone or carbon disulfide to remove traces of oil or tar. Add a few grams of magnesium nitrate. Heat gradually over a free Bunsen flame till water is all expelled and the magnesium nitrate melts. Rotate the flask to distribute the melt and continue the heating till the brown fumes of nitric oxide cease to evolve. Finally cool and dissolve the residual magnesium oxide in dilute acid by boiling.

Large deposits of carbon or tar will require a repetition of the above procedure.

Removing Carbon Residue from Glassware

Tri-sodium phosphate (Na_3PO_4)..... 2 tablespoonfuls
Sodium oleate 1 tablespoonful
Soft water. 1 quart

Allow to stand in the solution for several minutes, brush off the incrustation and rinse with water.

COLORED LIQUIDS

For rendering columns of water easily visible, add a few drops of one per cent alcoholic solution of fluorescein to a liter of water. The dilute solution of fluorescein is bright green by reason of its fluorescence, although colorless by transmitted light.

A small quantity of an aqueous (1 %) solution of uranine (the sodium salt of fluorescein) may be used in place of the alcoholic solution mentioned above.

ARTS AND RECIPES (Continued)

If liquids showing color by transmission are desired, dilute aqueous solutions may be made with any of the following dyes:

Dye	Color
Erythrosine	Pink
Eosine	Pink (green fluorescence)
Rhodamine B	Pink (red fluorescence)
Ponceau 2R	Scarlet
Naphthol green	Green
Methylene green	Bluish green
Methylene blue	Blue
Methyl violet	Purple

CROSS HAIRS

The spider lines which serve as an index in reading telescopes may be quickly replaced in an emergency by single silk fibers (from ordinary sewing silk) attached by soft wax. Single fibers may easily be removed from an untwisted strand.

Spider web should be used in permanent work. The fibers of the egg nest of certain species are employed and may be obtained of most dealers in scientific apparatus. In mounting them the following suggestions may be useful: The cross hair diaphragm of the telescope should be removed and clamped in a horizontal position. A bow of brass wire, about No. 28, should be employed to stretch the fiber. A background of black velvet makes the fibers more easily visible. With soft wax or other convenient adhesive ready on both tips of the bow, a fiber of the required length is to be disentangled with tweezers and wrapped several times about the ends of the bow under tension sufficient to straighten the fiber. The fiber, now conveniently handled by the wire bow, should be cautiously lowered onto the diaphragm in the proper position, the wire left hanging.

A small drop of shellac varnish applied at each side will hold the fiber in position as soon as it is thoroughly dry, after which the ends of the fiber should be cut away.

DIALYZERS

As a substitute for parchment and similar natural membranes, it has been found that those made from cellulose trinitrate are superior. Parlodion (DuPont) may be used, dissolving one part of the nitrate in 2 each of ethanol and ethyl ether. The water adhering to the Parlodion should first be removed (the shreds are preserved by covering with water), otherwise a clear solution will not be obtained. Cut the round end off a $\frac{3}{4}$ " or 1" test tube, and dip the flared end of the tube into the alcohol-ether solution of Parlodion. Upon removing the tube from the solution a film will be found across the tube and after evaporation of the solvents the film will be found to be of sufficient strength to meet the purposes of a dialyzer. The liquid to be dialyzed is poured into the tube and contents are then set in a beaker of water. In a short time the working of the semi-permeable membrane will be shown by the rise of the level of the liquid inside the tube.

EXPANSION OF GLASSES, TEST FOR EQUALITY OF

In order to compare the coefficients of expansion of two pieces of glass, prior to sealing them together, melt the drawn out ends of each piece to beads; press these molten beads together with tweezers and draw into a thread. If the glasses can be sealed

ARTS AND RECIPES (Continued)

together, the thread will be straight; otherwise, it will curve because of the different coefficients of expansion.

FLUORESCENT SCREENS

For observations of the ultraviolet spectrum, moisten a small quantity of anthracene with water and brush a thin layer over a ground-glass surface. On drying most of the anthracene will adhere to the glass. The prepared surface should be placed so as to receive the radiation directly, glass being comparatively opaque to the shorter wave lengths.

GLASS GRINDING FLUID

Turpentine	45 c.c.
Ether (ethyl oxide)	22.5 c.c.
Camphor gum	31 g

To be used with powdered emery for grinding glass.

For smoothing edges a sheet of emery cloth moistened with the above solution may be used.

Plane surfaces should be ground on thick plate glass.

For grinding glass stoppers use coarse emery, turn in one direction, finish with fine emery.

GLASS GRINDING MEDIUM

Glycerin may be used instead of a camphor-turpentine mixture for a medium in which to suspend emery powder for grinding glass. Glycerin has body enough and is sufficiently viscous to carry the emery well, and besides this it is water-soluble, thus making it very easy to wash away the excess grinding agent when the job is done or when it is desirable to make a close inspection of the work done.

HEATING BATH

A bath fluid at temperatures above 150° C. and which does not appreciably affect glass is prepared by fusing 10 parts of potassium nitrate with 8.5 parts of sodium nitrite.

HEATING BATHS

For uniform heating of reactions the following materials have proven satisfactory:

For temperatures up to 100° C.	Steam
For temperatures from 100° — 250° C.	Crisco or Nujol
For temperatures from 200° — 300° C.	<i>o</i> -tolyl phosphate
For temperatures above 250° C.	Wood's metal.

ECTOGRAPH FILLER

Ingredients: $\frac{1}{2}$ oz. of ground (dried) glue; 2 oz. of dried gelatine; 18 fluid oz. glycerin. These amounts should provide sufficient filler for a pan 12" \times 9" \times $\frac{1}{2}$ ".

Mix the glue with water and digest it on a water bath (a double boiler may be used) until it has the consistency of cream and is thoroughly melted. Soak the gelatine in cold water till soft, free it from as much water as is possible by pressure in a cheese-cloth and then melt it on a water bath or in a double boiler. Pour the three liquids together, and after they are thoroughly mixed, pour them into the pan. If any bubbles appear on the surface

ARTS AND RECIPES (Continued)

of the filler, scrape them off with the edge of a piece of cardboard while the filler is hot. Do not use the filler until at least six hours after it has been poured into the pan. The materials gel slowly. Keep the pan level and covered until its contents is no longer fluid.

HECTOGRAPH INK

Violet

Aniline violet	1 oz.
Hot water.....	7 oz. fl.

On cooling, add:

Alcohol	1 oz.
Glycerin	$\frac{1}{4}$ oz.
Carbolic acid (phenol)	a few drops

Black

Nigrosine	1 part
Water	14 parts
Glycerin	4 parts

HYDROGEN SULFIDE

Pure hydrogen sulfide may be generated by allowing distilled water to drop on aluminum sulfide.

HYDROGEN SULFIDE SUPPLY

Mix and heat slightly 3 parts by weight of sulfur with 1 part by weight of paraffin. Then mix with sufficient shredded asbestos to make a porous mass. Partly fill an 8" Pyrex test tube, connect with delivery tube and safety bottle. Heat. Furnishes good supply of H_2S . No leakage into the room as generation of H_2S ceases as soon as heat is removed. Mixture keeps. Test tube may be heated over again until reactants are used up.

INK FOR GLASS MARKING

Barium sulfate	15 parts by weight
Ammonium bifluoride ..	15 parts by weight
Ammonium sulfate ..	10 parts by weight
Oxalic acid	8 parts by weight
Glycerin	40 parts by weight
Water	12 parts by weight

If too thick, add more water. If the action is too slow, up to 5 % of sodium fluoride may be added. Use in a hood or well ventilated room.

LABEL PROTECTION

Collodion for Labels on Bottles

Dissolve 3-4 grams pyroxylin in 100 c.c. 1:3 mixture of alcohol and ether (25 c.c. absolute alcohol, 75 c.c. dry ether).

First soak the pyroxylin in the alcohol, then add the ether.

Labels for Bottles

Labels should be written in India Ink. They can be made waterproof and durable by coating with a saturated solution of paraffin in benzene.

ARTS AND RECIPES (Continued)

Lacquer for Protecting Labels

An excellent lacquer for protecting labels may be made by dissolving 20 grams of vinyl acetate polymer (Vinylite A) in 100 c.c. of a mixture of 3 parts of toluene and 1 part of 95 % alcohol. This lacquer forms a colorless, transparent film which resists most reagents very well.

Protecting Varnish for Labels

Typed labels may be protected by several coats of a varnish made by dissolving ordinary tooth brush handles in acetone. The quantity of solvent should be adjusted to give a convenient viscosity. The varnish is water and acid resistant.

LOW MELTING ALLOY

The following alloy, Wood's metal, melts at about 65° C.:

Bismuth.....	50	parts by weight
Lead	25	parts by weight
Tin.	12	5 parts by weight
Cadmium.....	12	5 parts by weight

LUBRICANT, DRY

Melt a quantity of paraffin and add as much fine flake or powdered graphite as is readily moistened by the melted wax. Cool and cut while soft into convenient sticks.

This lubricant when rubbed on the surfaces involved, adheres and greatly reduces friction. It is particularly useful when one or both of the surfaces are of wood or other non-metallic substance.

MILDEW PREVENTION ON LEATHER BOOK BINDINGS

Make a 2 % to 5 % solution—not more than 5 %—of copper sulfate. Immerse a soft towel or cloth in this solution. Remove the cloth and thoroughly wring out. Then hang out to dry. When thoroughly dried, it can be used to rub leather bound books. One treatment of the cloth will easily take care of scores or a hundred volumes, and the leather will not be marked by the chemical.

MIRRORS FOR SPECTROMETER ADJUSTMENT

A small square of thick plate glass with edges ground smooth and silvered on one surface affords a means of accurate adjustment.

To avoid the necessity of frequently resilvering, which arises where the mirrors are in constant use, the following course is suggested:

From selected German plate mirror 2 to 3 mm thick, cut two pieces of the same size, say 4 × 5 cm. Remove the protective layer of varnish or paint from both pieces by soaking in alcohol and rubbing with cotton, being careful not to injure the silver surface. From one piece remove every trace of varnish by repeated rinsing, dry and polish the silver surface thus exposed by stroking lightly with a chamois rouge pad. From the other piece remove the silver by nitric acid, wash thoroughly in distilled water and dry. Cement the clear piece on the silver face of the other with Canada balsam. This is accomplished by placing two or three drops of Canada balsam in xylol (obtained in collapsible tubes) on the center of the silver face, and evenly lowering upon it the clear glass. The balsam should spread rapidly to the edges of

ARTS AND RECIPES (Continued)

the plates Minute bubbles of air in the balsam film are harmless; if large bubbles are present the plates should be slipped apart, cleaned with alcohol and the process repeated.

The balsam will be sufficiently hard in a few days to allow the excess to be scraped from the edges and the plates bound together with lantern slide binding strip. Gentle heat may be used to harden the balsam more rapidly.

PHENOL (CARBOLIC ACID) BURNS

To c. p. glycerin add bromine until slightly colored or saturated. Keep in glass stoppered bottle and apply quickly to phenol burns. The bromide reacts instantly with the phenol to form phenyl bromides.

POLARITY TEST PAPER

Dissolve one gram of phenolphthalein in a small quantity of alcohol. Add the solution of phenolphthalein to 100 c.c. of a 10 per cent solution of potassium chloride in distilled water. Filter paper should be soaked in the solution and dried. A strip of paper moistened with water and placed in contact with the two terminals will show a bright red stain at the negative terminal.

PURIFICATION OF ALCOHOL

To remove aldehydes from alcohol intended for use in the preparation of alcoholic solutions of sodium or potassium hydroxide, add to one liter of alcohol 5 to 10 grams of aluminum or zinc and 8 to 10 grams of potassium hydroxide, boil under reflux for 20 minutes, and distil. Best results are obtained if an all-glass apparatus is used. Alcoholic solutions, prepared with alcohol so treated, will not discolor if the purification of the alcohol has been carefully carried out.

RESISTANT PAINTS AND VARNISHES

Acid Proof Wood Stain

Solution No. 1	Solution No. 2
125 grams of copper sulfate	150 grams of good fresh anilin oil
125 grams of potassium chlorate	180 grams of concentrated hydrochloric acid
1000 grams of water	1000 grams of water

Wood must be free from paint, varnish, grease or chemicals. Apply two coats of solution No. 1 boiling hot with a paint brush, allowing each coat to dry thoroughly before the next coat is applied. Then apply two coats of solution No. 2 in the same way. When the wood is completely dried wash off excess chemicals with hot soapsuds. Finish with raw linseed oil. Polish comes from rubbing the oil down well with a cloth or sponge. Whenever the tables get dingy again go over them with a coat of linseed oil and rub smooth.

Resistant Coal Tar Varnish

A resistant varnish is made from coal tar pitch as follows:

Coal tar pitch	65 parts by weight
Phenol	5 parts by weight
Benzene	30 parts by weight

ARTS AND RECIPES (Continued)

Resistant Paint

The following paint when used on galvanized iron has been found to hold up well, without cracking or peeling in a three year's test. It can also be used on black iron, tin, copper, or stone such as is used for laboratory desk tops. It withstands dilute acids.

Formula: Stir in 10 parts by weight of benzol into 30 parts by weight of ordinary thin coal tar. Then add with vigorous stirring 10 parts by weight of Silica Black (a new product patented under U. S. No. 1,940,352).

SCALE POLISH

To brighten up refractometer and polarimeter scales without injury to the metal rub with bone black or clarifying charcoal. A dry cloth with a little of the bone black is rubbed on the scale until a bright polish is produced. The divisions then stand out clearly and are easily read. The great advantage is that the fine lines are not worn away and no corrosive material is left to cause discolorations.

SILVERING GLASS

BRASHEAR'S PROCESS

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission.)

Two solutions are required, one, the reducing solution, should be prepared at least a week before it is used, and it may be made in large quantity and kept in stock with advantage; the other solution is to be prepared when used.

REDUCING SOLUTION

Distilled water	700 c.cm.
Pure sugar (loaf, granulated or rock candy)	80 g.

When dissolved add

Alcohol	175 c.cm.
Strong nitric acid (sp. gr. 1.42)	3 c.cm.
Add water to make	1000 c.cm.

For silvering, the mirror may rest face up on the bottom of a suitable dish; it may stand on edge, or be supported in any manner, face downward, dipping into the upper part of the solution. In the latter case, the mirror may be fastened with wax to a stick laid across the dish, or it may be supported on glass feet or on paraffined wood wedges. Dr. Brashear recommends that the mirror, if round, form the bottom of the silvering dish, which is completed by wrapping a strip of paraffined paper around the edge of the mirror, this being held in place by rubber bands or fastened with several wrappings of cord.

Having selected a dish and support for the mirror, measure with water the quantity of solution that will be required to make a layer a centimeter or two thick over the surface to be silvered. For each 150 c.cm. of final solution, 1 g. of silver nitrate and 0.5 g. of caustic potash (purified by alcohol) will be required. Dissolve the silver and potash separately, using quantities of water of the proportion of 100 c.cm. to 1 g. of the solid. Ordinary graduates or flasks are the most convenient form of vessel in which to mix the solutions. Into the silver nitrate solution pour a few drops of dilute aqua ammonia. The solution will turn to a dark brown color; add ammonia little by little till the precipitate is nearly but not quite redissolved. Now add the potash solution,

ARTS AND RECIPES (Continued)

when a precipitate will again be formed. This is to be nearly, but not entirely, redissolved by the addition of more ammonia, a few drops being sufficient this time. After the ammonia has been added shake or stir the solution well and wait a minute or two to be certain that it does not entirely clear. If by chance too much ammonia has been used, a little silver nitrate is to be dissolved and added, a few drops at a time, till a permanent precipitate is formed. This excess of silver must be present, the solution showing a decided brown tint. The solution may be filtered, though usually this is not necessary.

A quantity of reducing solution equal to about a twenty-fifth part of the solution just prepared is measured out. The mirror, having been properly cleaned and rinsed with distilled water, is placed in position. The reducing solution is poured into the silver and potash solution, and mixed by a quick shaking of the graduate or stirring with a glass rod; the whole is then poured into the dish. If the mirror is immersed face down, care is necessary to remove air bubbles; the mirror may well be immersed after the solution is in, being dipped in at one side first. If the mirror is at the bottom of the dish, after cleaning it is covered with a thin layer of water, and the prepared solutions are poured into the dish without further trouble. In the latter case the dish must be rocked during the time of deposition.

The solution soon turns to a black color, which in a few minutes will turn to a brown; and when it becomes a light gray and the precipitate is flocculent, which may be in ten or fifteen minutes, the operation is at an end. If the mirror is allowed to remain in the solution too long, the surface will have a bleached appearance, which polishing will hardly remove. Remove the mirror, rinse with water, and carefully wipe off the sediment with a tuft of absorbent cotton. It is then set on edge to dry; a rinsing with alcohol will facilitate the drying, or all water may be safely taken up by pressing clean blotting paper over the surface.

When dry, the surface may be polished, if necessary, with a small pad of chamois leather stuffed with cotton, on which is spread a little rouge. Small, circular strokes of the pad, with light pressure, will soon bring out the deep luster of the silver.

A uniform temperature of the bath and the glass, of about 20° is essential to success.

Since fulminating silver is liable to be produced by the action of ammonia on silver oxide, especially in a warm room, all solutions should be thrown away as soon as the silvering operation is completed. The used solutions may be poured into a large jar, in which is thrown some common salt; this causes the silver to be precipitated as the chloride, and about 90 per cent of the original silver may be recovered.

ROCHELLE SALTS PROCESS

(From Miller's Laboratory Physics, Ginn & Co., publishers, by permission)

For depositing the uniform thin film of silver required on the half-silvered glass of the interferometer, the following method is more suitable than the one described above, as the silver is deposited more slowly. If a thick film is desired, two or more successive deposits may be made, each of which may require an hour's time.

Dissolve 5 g. of silver nitrate in 300 c.cm. of distilled water, and add dilute aqua ammonia until the precipitate formed is nearly, *but not entirely*, redissolved in the manner explained in

ARTS AND RECIPES (Continued)

the preceding method. Filter the solution and add water to make 500 c.cm.

Dissolve one g. of silver nitrate in a small quantity of water and pour into about half a liter of boiling water; dissolve 0.83 g. of Rochelle salts in a small quantity of water, and add to the boiling solution. Continue the boiling for half an hour, till the gray precipitate collects as a powder in the bottom of the flask. Filter hot, and add water to make 500 c.cm.

These solutions may be kept in the dark for a month or two.

For silvering, equal volumes of the two solutions are mixed, and the glass is supported in the mixture in whatever fashion is convenient. Various methods are mentioned in the preceding article. The thickest possible deposit may require an hour's time. A second deposit may be made upon the first if necessary to secure the desired thickness. The drying and polishing may be carried out as described above.

A half-silvered film will be produced in about a minute; only experience can determine when the proper thickness has been secured. The glass appears as though it were very lightly smoked. A film that reflects a little more than half the light incident at 45° is desirable for interferometer use. A simple method of testing is to look at two similar gas flames, one seen through the film and the other seen reflected by it. It is well to silver at once all four surfaces of the two plane-parallel plates of the interferometer and to select for use that film which is of the proper and most uniform thickness.

SOAP SOLUTION FOR SOAP FILM EXPERIMENTS

Pure castile or palm-oil soap	1 oz.
Distilled water	8 oz.
Pure glycerin	4 oz.

Cut the soap in thin shavings and dissolve in the water. When the solution is complete, add the glycerin and mix very thoroughly. On standing the liquid becomes clear at the bottom. The clear portion may conveniently be removed by a siphon and preserved indefinitely.

SODIUM FLAME

An intense sodium flame is readily obtained by placing a small lump of rock salt in the center of the screen on a lighted Meker burner.

SODIUM LIGHT

Paper is to be soaked in a saturated solution of common salt, borax or other salt of sodium, and dried. When wrapped around a Bunsen burner, secured by a twist of wire and pushed up into the edge of the flame, a sodium flame of considerable intensity is obtained. As the ash of the paper breaks away it must be occasionally raised. Lithium chloride may be used in place of or with sodium salt to give the lithium line for spectrometric measurement. Sheet asbestos (thin) may replace the paper if desired. Since the asbestos is not consumed it is necessary to moisten the mantle with salt solution at intervals.

SOLDERING PYREX GLASS TO METAL

Dip the Pyrex glass tube to be soldered into a solution of chlor-platinic acid (or platinic chloride may be substituted) made by

ARTS AND RECIPES (Continued)

preparing a mixture consisting of 0.2 gram of the acid with 5 c.c. each of alcohol and ethyl ether to which 4 or 5 drops of turpentine have been added. After dipping the tube, carefully burn all the adhering liquid away leaving a film of platinum metal. That film will serve to hold the solder to the Pyrex glass and in doing so makes a very satisfactory gas-tight joint for a metal to glass connection.

SOLDERS

Composition by weight						Temperature of fusion	Metals for which it is used	Flux commonly used
Lead	Tin	Copper	Zinc	Silver	Gold			
1	1					188° C	Lead	Tallow
3	5					176	Zinc	Zinc chloride
2	5					170	Copper brass	25% HCl
							Iron	Zinc chloride (neutral) or resin
		2	1				Fe, Cu,	Zinc chloride or NH ₄ Cl
		55	45			880	Fe, Cu, brass	Borax
		4 5	0 5	15 0		100.5	Fe, Cu, Au,	Borax
		6 5	2 0	11 0		98.3	Fe, Cu, Au,	Borax
		4		6	10		Gold	

STOPCOCK LUBRICANTS

Seal for Ground Glass Joints

Glycerin makes a very satisfactory seal for ground glass joints to prevent leakage of petroleum ether, ethyl ether or any other fluid in which glycerin is insoluble. Glycerin on the ground glass surface prevents sticking and so allows for the easy dismantling of the apparatus.

Stopcock Grease

Shepherd and Ledig (J. Ind. Eng. Chem. 19, 1059, 1927) prepare stopcock grease from the following ingredients by mixing with continuous stirring for 190 hours at 155° C., then placing the mixture in small 2 oz. containers, immediately chilling the contents on ice and allowing to age for 10 days before use. For high vacuum: 31 parts crepe rubber, 24 parts white "Vaseline" petroleum jelly, 5 parts paraffin (m. p. 36° C.); for general lubricant: 6 parts crepe rubber, 7 parts "Vaseline" petroleum jelly, 1 part paraffin; for light lubricant: 10 parts smoked sheet or pale crepe rubber, 18 parts "Vaseline" petroleum jelly and 1 part paraffin (m. p. 30° C.).

Stopcock Grease

Black rubber (red or pure gum)	1 part
Paraffin	2 parts
"Vaseline" petroleum jelly	4 parts

Melt the paraffin and "Vaseline" petroleum jelly together, add the rubber slowly and in small pieces taking care not to burn the rubber. A larger quantity of "Vaseline" petroleum jelly may be desirable.

ARTS AND RECIPES (Continued)

Stopcock Lubricant

Petrolatum (500 grams) and raw crepe rubber (50 grams) are stirred together and kept in an oven at 125°–150° C. for several days, or until the mixture is homogeneous.

Stopcock Lubricant

Standard Viscous Oil No. 32 (Standard Oil Co. of California)	200 grams
Aluminum stearate	50 grams

Dissolve the stearate in the oil, heated to about 150° C., and cool. This makes an extremely sticky, ropy, tough adhesive for ground glass surfaces.

Stopcock Lubricant

In the laboratory it is often desirable to have a stopcock lubricant that will not dissolve away with the ordinary fat solvents such as the hydrocarbons or chlorinated hydrocarbons. In some set-ups the ordinary stopcock greases are quite useless, and syrupy phosphoric acid is very unsatisfactory.

A paste of Bentonite (colloidal clay) and glycerin may be used for such a purpose. One can adjust the viscosity of the paste to suit his needs. Such a lubricant is entirely unaffected by the non-aqueous solvents, and even in the presence of water holds remarkably long, probably due to the fact that the Bentonite makes a jelly with either glycerin or water. In addition it has the very decided advantage of permitting a stopcock lubricant to be used at temperatures up to or even well above 100° C. The viscosity does not diminish very much with rise in temperature.

UNIVERSAL WAX

(1) A soft wax useful in the laboratory may be made by melting together paraffin, "Vaseline" petroleum jelly and paraffin oil in various proportions according to the pliability desired.

(2) Another authority recommends equal quantities of beeswax and turpentine (by weight). It is customary to color the wax by adding finely-powdered Venetian red.

(3) Melt together 1 part of Venice turpentine and 5 parts of beeswax. Color with vermilion.

PHOTOGRAPHIC FORMULAE

Pure water, preferably distilled, should be used in all solutions. Chemicals should be dissolved in the order given.

Desiccated or anhydrous sodium carbonate and sodium sulfite are specified in the following formulae. If the crystalline forms are employed, a larger quantity must be used.

Sodium carbonate exists in three forms: the anhydrous or desiccated, Na_2CO_3 ; the monohydrate, $\text{Na}_2\text{CO}_3 \cdot \text{H}_2\text{O}$; "washing soda," $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$. If the monohydrate is substituted for the desiccated, 1.17 times the specified quantity should be used. If the "crystal" form $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$ is substituted for the desiccated, 2.7 times the specified quantity should be used.

Sodium sulfite exists in two forms; the anhydrous or desiccated, Na_2SO_3 , and a form, $\text{Na}_2\text{SO}_3 \cdot 7\text{H}_2\text{O}$. If the latter "crystal" form is substituted for the desiccated, 2 times the specified amount should be used.

Quantities required are given in both English and metric units. The values are, in most cases, not interchangeable since the amounts of water are not the same. According to recent usage quantities of liquid are often specified in milliliters (ml). The milliliter is 1.000027 cubic centimeters; the units are, of course, interchangeable for photographic formulae. The U. S. avoirdupois system of weights is used.

The following abbreviations are employed:

anh.	anhydrous
c.c.	cubic centimeter
dr.	dram
g	gram
gal.	gallon
gr.	grain
l	liter
min.	minim
ml	milliliter (equivalent to cubic centimeter cm or c.c.)
oz. (av.)	ounce (avoirdupois)
oz. fl.	fluid ounce
qt.	quart

DEVELOPERS FOR PLATES AND FILMS

When a time of development is suggested, it is intended to serve as a guide only. Individual requirements as to density and contrast vary. Greater or less contrast may be obtained by developing for a longer or a shorter time respectively.

GENERAL PURPOSE NEGATIVE DEVELOPERS

Amidol (Diaminophenol hydrochloride)

For plates and films, to be mixed immediately before use.

Water.....	10 oz. fl.	1000 ml
Sodium sulfite, anh	120 gr.	29 g
Amidol.....	30 gr.	7 g
Potassium bromide	6-10 gr.	1.4-2 g

Amidol oxidizes so rapidly in solution that it is customary to make up this developer immediately before it is to be used. The time required for development is from 3 to 5 minutes at 18° C. or 65° F.

PHOTOGRAPHIC FORMULAE (Continued)

Amidol

Sulfite Stock Solution

Sodium sulfite, anh.....	2 oz.	100 g
Potassium metabisulfite..	0.5 oz.	25 g
Water..	20 oz.	1000 c.c.

Boil after dissolving in warm water. Developer is made when needed by adding dry amidol to the stock solution of sulfite which keeps for a long period.

Stock solution of sodium sulfite .	2 oz.	200 c.c.
Water.	10 oz.	1000 c.c.
Amidol	20-30 gr.	4.5-7 g

Athenon. See Glycin

Elon-Hydroquinone (Kodak D-76)

Developer for maximum speed at normal contrast on films and plates.

Water, about 125° F. (52° C.)..	24 oz.	750 c.c.
Elon...	29 gr.	2 g
Sodium sulfite, desiccated.....	3 oz. 145 gr. (1458 gr.)	100 g
Hydroquinone	73 gr.	5 g
Borax, granular	29 gr.	2 g
Water to make.	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

Average development time about 17 minutes at 68° F. (20° C.). See individual recommendations listed for each material.

Replenisher (Kodak D-76R)

Water, about 125° F. (52° C.)..	24 oz.	750 c.c.
Elon	44 gr.	3 g
Sodium sulfite, desiccated.....	3 oz. 145 gr. (1458 gr.)	100 g
Hydroquinone	1 oz.	7.5 g
Borax, granular	290 gr.	20 g
Water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

Use the replenisher without dilution and add to the tank to maintain the activity of the developer.

Elon-Hydroquinone-Pyro (Kodak D-75)

A long life deep tank developer for roll film.

Solution No. 1

Water (about 125° F.) (52° C.)..	16 oz.	500 c.c.
Elon	44 gr.	3 g

Solution No. 2

Water (about 125° F.) (52° C.).....	16 oz.	500 c.c.
Sodium sulfite, anh	260 gr.	18 g
Sodium bisulfite	1 oz. 85 gr.	36 g

Solution No. 3

Hot water (about 160° F.) (71° C.).....	16 oz.	500 c.c.
Sodium sulfite, anh	260 gr.	18 g
Hydroquinone....	175 gr.	12 g
Pyro.	44 gr.	3 g

PHOTOGRAPHIC FORMULAE (Continued)

Solution No. 4

Water (about 125° F.) (52° C.)..... 16 oz. 500 c.c.
Sodium carbonate, anh..... 2 oz. 175 gr. 72 g

Mix each solution separately and add to the tank at once in the order given.

Then add water to make..... 1 gal. 4000 c.c.

Develop 7 to 14 minutes at 65° F. (18° C.), in the fresh developer according to the contrast desired. Greater or less contrast may be obtained by developing for longer or shorter times than those specified. Avoid the use of galvanized ware when mixing, or trouble from fog will be encountered. Cool the mixture of the first three solutions, before adding the cooled solution No. 4 to it, to avoid effervescence.

For small scale mixing, that is, less than 1 gallon (4000 c.c.), all the chemicals may be dissolved in the order given in one-half the total volume of water (125° F.) (52° C.) and cold water added to make up to volume.

Replenisher Stock Solution

Water (about 125° F.) (52° C.) .. 64 oz. 2000 c.c.
Elon..... ½ oz. 15 g
Sodium sulfite, anh..... 3 oz. 90 g
Sodium bisulfite..... 3 oz. 90 g
Hydroquinone..... 1 oz. 30 g
Sodium carbonate, anh..... 8 oz. 240 g
Water to make..... 1 gal. 4000 c.c.

Dilute 1 part of stock solution with 1 part of water and add to the tank as required.

Elon-Pyro (Kodak D-7)

Stock Solution A

Water (about 125° F.) (52° C.). 16 oz. 500 c.c.
Elon..... ½ oz. 7.5 g
Sodium bisulfite ½ oz. 7.5 g
Pyro 1 oz. 30 g
Potassium bromide..... 60 gr. 4.2 g
Water to make..... 32 oz. 1000 c.c.

Stock Solution B

Water..... 32 oz. 1000 c.c.
Sodium sulfite, desiccated..... 5 oz. 150 g

Stock Solution C

Water..... 32 oz. 1000 c.c.
Sodium carbonate, desiccated..... 2½ oz. 75 g

Dissolve chemicals in the order given

TRAY DEVELOPMENT: Take 1 part of A, 1 part of B, 1 part of C, and 8 parts of water. Develop about 7 minutes at 68° F. (20° C.).

TANK DEVELOPMENT: Take 1 part of A, 1 part of B, 1 part of C, and 13 parts of water. Develop about 10 minutes at 68° F. (20° C.).

This developer can be used for two or three weeks if the volume is maintained by adding fresh developer in the proportion of 1 part each of A, B, and C to 4 parts of water. It is usually necessary to increase the development time as the developer ages.

PHOTOGRAPHIC FORMULAE (Continued)

Glycin (Parahydroxyphenyl glycin)

Stock Solution

Water.....	10 oz. fl.	1000 ml
Sodium sulfite, anh.....	300 gr.	68.5 g
Glycin.....	120 gr.	27.5 g
Sodium carbonate, anh.....	240 gr.	54.8 g

TRAY DEVELOPMENT: Dilute with 4 parts of water to 1 of stock solution. Develop 6 to 10 minutes.

TANK DEVELOPMENT: Use 15 parts of water to 1 of stock solution; develop 20 to 30 minutes.

Glycin developer keeps well. The image is fine-grained and free from fog or stain.

Glycin

Stock Solution

Hot water (200° F.)	60 oz.	1700 c.c.
Sodium carbonate, anh.....	2 oz.	57 g
Glycin.....	0.5 oz.	14 g
Sodium sulfite, anh.....	0.5 oz.	14 g

Dissolve in order. For use take stock solution, 6 parts; water, 58 parts.

At 60° F. develop 30 min.; at 65° F. 25 min.; at 70° F. 20 min.

Glycin (Kodak D-78)

Water.....	2.5 qt.	750 c.c.
Sodium sulfite, anh.....	175 gr.	3 g
Glycin.....	175 gr.	3 g
Sodium carbonate, anh.....	350 gr.	6 g
Water to make.....	1 gal.	1000 c.c.

Time of development: 15 to 25 minutes at 65° F. (18° C.)

Glycin Developer (Agfa 72)

This formula is recommended for use with commercial films in reproduction work and is also suitable for development of roll, pack and cut film.

Stock Solution

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Sodium sulfite, anh....	4½ oz.	1 lb. 1 oz.	125 g
Potassium carbonate.....	8½ oz.	2 lb. 2 oz.	250 g
Glycin	1½ oz. 80 gr. (736 gr.)	6½ oz.	50 g
Water to make. . . .	32 oz.	1 gal.	1000 c.c.

TANK DEVELOPMENT: Take one part stock solution, fifteen parts water and develop 20 to 25 minutes at 65° F. (18° C.).

TRAY DEVELOPMENT: Take one part stock solution, four parts water and develop 5 to 10 minutes at 65° F. (18° C.).

Hydroquinone

Water..	10 oz. fl.	1000 ml
Sodium sulfite, anh.....	220 gr.	50 g
Hydroquinone.....	50 gr.	11.5 g
Sodium carbonate, anh.....	162 gr.	37 g

For use take 1 part of water to 1 part of stock solution. This is a slow acting developer. The temperature should not be allowed to fall below 60° F. (15° C.) as the developer becomes inert.

PHOTOGRAPHIC FORMULAE (Continued)

Metaborate Metol-Hydroquinone (Agfa 48M)

This formula is recommended for photofinishing, professional, and amateur developing and is suitable for deep tank use over a long period of time.

Hot water (125° F. or

52° C.)...	3 qt.	2½ gal.	750 c.c.
Metol.....	119 gr.	418 gr.	2 g
Sodium sulfite, anh..	5½ oz.	1 lb. 2¼ oz. (18¼ oz.)	40 g
Hydroquinone.....	88 gr.	309 gr.	1.5 g
Sodium metaborate..	1½ oz. 30 gr. (577 gr.)	4½ oz.	10 g
Potassium bromide..	30 gr.	1 oz.	.5 g
Water to make...	1 gal.	3½ gal.	1000 c.c.

Do not dilute for use.

TANK DEVELOPMENT: Normal developing time 5 to 7 minutes at 65° F. (18° C.).

TRAY DEVELOPMENT: Normal developing time 4 to 6 minutes at 65° F. (18° C.).

Replenisher (Agfa 48M)

Add whenever necessary to keep tank up to full volume.

Hot water (125° F. or 52° C.)...	24 oz.	3 qt.	750 c.c.
Metol.....	90 gr.	358 gr.	6.3 g
Sodium sulfite, anh..	1 oz.	4 oz.	30 g
Hydroquinone.....	144 gr.	1½ oz.	10 g
Sodium metaborate ..	1½ oz.	5 oz.	40 g
Water to make...	1 qt.	1 gal.	1000 c.c.

Metol

Water, warm.....	20 oz.	1000 c.c.
Metol.....	150 gr.	17 g
Sodium sulfite, anh..	1.25 oz.	63 g
Sodium carbonate, anh.....	1.75 oz.	88 g
Potassium bromide..	16 gr.	1.8 g

Always dissolve metol first.

For use dilute with equal part of water for portraiture; for landscape use two parts of water to one of stock solution. Gives detail without density except by prolonged development.

Metol-Hydroquinone

Note: Elon may be used with hydroquinone in place of metol, in equal quantity.

Solution A

Water..	64 oz.	1820 c.c.
Metol..	120 gr.	7.8 g
Hydroquinone	120 gr.	7.8 g
Sodium sulfite, anh	2 oz.	57 g

Solution B

Water.....	16 oz.	455 c.c.
Sodium carbonate, anh.....	2 oz.	57 g

For use take A, 4 oz.; B, 1 oz.; water, 4 oz.

PHOTOGRAPHIC FORMULAE (Continued)

Metol-Hydroquinone Tray Developer (Agfa 40)

This is a brilliant tray developer for roll, pack and sheet film.

Stock Solution			
Hot water (125° F. or 52° C.)	29 oz.	3½ qt.	900 c.c.
Metol....	66 gr.	264 gr.	4.5 g
Sodium sulfite, anh.	1½ oz. 25 gr. (791 gr.)	7½ oz.	54 g
Hydroquinone.....	½ oz.	1 oz.	7.5 g
Sodium carbonate, mono- hydrated	1½ oz. 25 gr. (791 gr.)	7½ oz.	54 g
Potassium bromide.....	45 gr.	189 gr.	3 g
Water to make..	32 oz.	1 gal.	1000 c.c.

For use dilute 1 part stock solution with 2 parts water.

Development time 4 to 5 minutes at 65° F. (18° C.).

Metol-Hydroquinone Tray Developer (Agfa 61)

This developer is recommended for use with commercial film to produce negatives of normal contrast. It may also be used satisfactorily for roll, pack and sheet film for negatives of average brilliance.

Hot water (125° F. or 52° C.)....	24 oz.	3 qt.	750 c.c.
Metol....	15 gr.	60 gr.	1 g
Sodium sulfite, anh.	½ oz.	2 oz.	15 g
Hydroquinone	30 gr.	119 gr.	2 g
Sodium carbonate, monohydrated .	½ oz.	2 oz.	15 g
Potassium bromide... ..	15 gr.	60 gr.	1 g
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use. Normal development time, 4 to 6 minutes at 65° F. (18° C.).

Metol-Hydroquinone Developer (Agfa 47)

This is a long-life, clean-working formula which will give excellent results as a standard film developer for either tray or tank development.

Hot water (125° F. or 52° C.)	3 qt.	2½ gal.	750 c.c.
Metol....	88 gr.	309 gr.	1.5 g
Sodium sulfite, anh	6 oz.	1 lb. 5 oz. (21 oz.)	45 g
Sodium bisulfite... ..	60 gr.	½ oz.	1 g
Hydroquinone... ..	179 gr.	1½ oz. 80 gr. (627 gr.)	3 g
Sodium carbonate, mono- hydrated.. . . .	348 gr.	2½ oz.	6 g
Potassium bromide.....	47 gr.	269 gr.	.8 g
Water to make.....	1 gal.	3½ gal.	1000 c.c.

TANK DEVELOPMENT: Used without dilution. Normal development time 6 to 8 minutes at 65° F. (18° C.) with occasional agitation. For longer developing times, dilute one part developing solution with one part water and develop 12 to 16 minutes at 65° F. (18° C.).

PHOTOGRAPHIC FORMULAE (Continued)

TRAY DEVELOPMENT: Normal development time 5 to 7 minutes at 65° F. (18° C.).

Replenisher (Agfa 47A)

Add whenever necessary to keep tank up to full volume.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	45 gr.	179 gr.	3 g
Sodium sulfite, anh.....	1½ oz.	6 oz.	45 g
Sodium bisulfite.....	30 gr.	119 gr.	2 g
Hydroquinone.....	88 gr.	348 gr.	6 g
Sodium carbonate, mono-hydrated.	174 gr.	1½ oz. 50 gr. (706 gr.)	12 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

Metol-Hydroquinone Tank Developer (Agfa 42)

This is a soft-working tank formula recommended for pack, roll and portrait films.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	12 gr.	47 gr.	.8 g
Sodium sulfite, anh.....	1½ oz.	6 oz.	45 g
Hydroquinone.....	18 gr.	70 gr.	1.2 g
Sodium carbonate, mono-hydrated.	119 gr.	1 oz. 40 gr. (478 gr.)	8 g
Potassium metabisulfite.....	59 gr.	239 gr.	4 g
Potassium bromide ..	22 gr.	88 gr.	1.5 g
Water to make...	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Develop 15 to 20 minutes at 65° F. (18° C.).

Ortol

Solution A

Ortol	140	gr.	16 g
Potassium metabisulfite..	70	gr.	8 g
Cold water.....	20	oz.	1000 c.c.

Solution B

Sodium carbonate, anh.....	1.25 oz.	63 g
Sodium sulfite, anh.....	1.75 oz.	88 g
Potassium bromide ..	10-20 gr.	1.1-2.3 g
Water.....	20 oz.	1000 c.c.

For rapid developer take A, 1 part; B, 1 part. For slower, softer development take A, 1 part; B, 1 part; water, 1 part.

Paraformaldehyde Developer (Agfa 79B)

(Two Solution)

This developer has better keeping quality than when made in one solution.

Solution 1

Water (not over 90° F. or 32° C.).....	24 oz.	3 qt.	750 c.c.
Sodium sulfite, anh.....	15 gr.	60 gr.	1 g
Paraformaldehyde.....	1 oz.	4 oz.	30 g
Potassium metabisulfite.....	154 gr.	1½ oz. 60 gr. (607 gr.)	10.5 g
Water to make.	32 oz.	1 gal.	1000 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

Solution 2				
Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750	c.c.
Sodium sulfite, anh.	4 oz.	1 lb.	120	g
Boric acid.	1 oz.	4 oz.	30	g
Hydroquinone	3 oz.	12 oz.	90	g
Potassium bromide.	88 gr.	348 gr.	6	g
Water to make.	96 oz.	3 gal.	3000	c.c.

For use mix one part Solution 1 with three parts Solution 2.

Normal development time 2 to 3 minutes at 65° to 70° F. (18° to 21° C.).

Paraminophenol

Water, boiling.	20 oz.	1000	c.c.
Potassium metabisulfite.	6 oz.	300	g
Paraminophenol.	2 oz.	100	g

Add sodium or potassium hydroxide in small quantities to dissolve the precipitate first formed.

For use take 1 part stock solution with 20 parts water.

Pyro Developer (Agfa 45)

This formula is recommended to those who prefer Pyro development. Stock solutions should be kept in stoppered bottles.

Solution 1				
Sodium bisulfite	144 gr.	1½ oz. 25 gr. (572 gr.)	9.8	g
Pyro.	2 oz.	8 oz.	60	g
Potassium bromide.	16 gr.	64 gr.	1.1	g
Water to make	32 oz.	1 gal.	1000	c.c.

Solution 2				
Sodium sulfite, anh.	3½ oz.	14 oz.	105	g
Water to make	32 oz.	1 gal.	1000	c.c.

Solution 3				
Sodium carbonate, mono-hydrated	2½ oz.	11 oz.	85	g
Water to make	32 oz.	1 gal.	1000	c.c.

TANK DEVELOPMENT: Take one part each Solutions 1, 2, 3 and add 11 parts water. Normal development time, from 9 to 12 minutes at 65° F. (18° C.).

TRAY DEVELOPMENT: Take 1 part each Solutions 1, 2, 3 and add 7 parts water. Normal development time, from 6 to 8 minutes at 65° F. (18° C.). Solutions will keep well when stored separately but final developer should be used immediately after mixing.

Pyro Developer (Kodak D-1)

Stock Solution A				
Sodium bisulfite.	140	gr.	9.8	g
Pyro.	2	oz.	60	g
Potassium bromide.	16	gr.	1.1	g
Water to make.	32	oz.	1000	c.c.

Stock Solution B				
Water.	32	oz.	1000	c.c.
Sodium sulfite, anh.	3½	oz.	105	g

PHOTOGRAPHIC FORMULAE (Continued)

Stock Solution C

Water.	32 oz.	1000	c.c.
Sodium carbonate, anh.	2½ oz.	75	g

For tray development take 1 part of A, 1 part of B, 1 part of C, and 7 parts of water. Develop about 5 to 7 minutes at 65° F. (18° C.).

For tank development take 1 part of A, 1 part of B, 1 part of C, and 11 parts of water. Develop about 12 minutes at 65° F. (18° C.).

Pyro Developer (Kodak D-90)

Stock Solution A

Sodium sulfite, anh.	2 oz.	145	gr.	70	g
Sodium bisulfite		245	gr.	17	g
Pyro		290	gr.	20	g
Water to make.	32 oz.			1000	c.c.

Stock Solution B

Sodium carbonate, anh.	2½ oz.	75 g
Potassium bromide	15 gr.	1 g
Water to make	32 oz.	1000 c.c.

For average use take 1 part of stock solution A, 1 part of stock solution B, and 2 parts of water. Develop 4 to 6 minutes at 65° F. (18° C.). For greater contrast, use 1 part of A, 1 part of B, and 1 part of water; for less contrast, use 1 part of A, 1 part of B, and 4 parts of water.

Pyro Tank Developer

Water.	48 oz.	1360	c.c.
Sodium sulfite, anh.	115 gr.	7.5	g
Sodium carbonate, anh	90 gr.	5.8	g
Pyro	45 gr.	2.9	g

Dissolve immediately before use. Use full strength.
Develop 15 minutes at 65° F. (18° C.).

Pyro Tank Developer

(Three Solutions)

Solution A

Water	16 oz.	455	c.c.
Oxalic acid.	10 gr.	0.65	g
Pyro	1 oz.	28	g

Solution B

Water.	16 oz.	455	c.c.
Sodium sulfite, anh.	3 oz.	85	g

Solution C

Water	16 oz.	455	c.c.
Sodium carbonate, anh.	1 oz.	28	g

For use take A, 1 part; B, 1 part; C, 1 part; water, 61 parts. Develop 30 minutes at 65° F. (18° C.) for best results.

For temperature 60° F. develop 35 minutes.

For temperature 65° F. develop 30 minutes.

For temperature 70° F. develop 25 minutes.

PHOTOGRAPHIC FORMULAE (Continued)

CONTRAST NEGATIVE DEVELOPERS

Elon-Hydroquinone

Contrast Developer for Photomicrography

Water (52° C.)	16 oz.	500 c.c.
Elon	14 gr.	1 g
Sodium sulfite	2½ oz.	75 g
Hydroquinone	130 gr.	9 g
Sodium carbonate	360 gr.	25 g
Potassium bromide	70 gr.	5 g
Water to make	32 oz.	1000 c.c.

Elon-Hydroquinone (Kodak D-11)

Process tank or tray developer for high contrast on films and plates.

Water, about 125° F. (52° C.)	16 oz.	500 c.c.
Elon	15 gr.	1 g
Sodium sulfite, desiccated	2½ oz.	75 g
Hydroquinone	130 gr.	9 g
Sodium carbonate, desiccated	365 gr.	25 g
Potassium bromide	73 gr.	5 g
Cold water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

For process photography use without dilution. For development of copies of continuous-tone subjects, dilute with an equal volume of water. Develop about 5 minutes in a tank or 4 minutes in a tray at 68° F. (20° C.).

Hydroquinone Developer for Line Work

Also for lantern slides, or wherever increased contrast is desired.

A	
Distilled water	32 oz.
Hydroquinone	1½ oz.
Sodium sulfite, anh	1 oz.
Sulfuric acid (conc)	60 min.

B	
Distilled water	32 oz.
Sodium carbonate, anh	1 oz.
Potassium carbonate, anh	3 oz.
Potassium bromide	130 gr.
Sodium sulfite, anh	3 oz.

For tray or tank development, use equal parts of A and B without further dilution. Develop at 65° F. for 5 to 10 minutes according to exposure or density desired.

Hydroquinone-Caustic Soda (Kodak D-9)

Process Tray Developer

Stock Solution A

Water (about 125° F.) (52° C.)	16 oz.	500 c.c.
Sodium bisulfite	3 oz.	22.5 g
Hydroquinone	2 oz.	22.5 g
Potassium bromide	3 oz.	22.5 g
Cold water to make	32 oz.	1000 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

Stock Solution B

Cold water.....	32 oz.	1000 c.c.
Sodium hydroxide (caustic soda).....	1½ oz.	52.5 g

Use equal parts of A and B and develop not more than two minutes at 65° F. (18° C.). Wash thoroughly after development and before fixing, otherwise stains and dichroic fog will result. Development slows up greatly below 55° F. (13° C.).

Cold water should always be used when dissolving sodium hydroxide (caustic soda) because considerable heat is evolved. If hot water is used, the solution will boil with explosive violence and may cause serious burns if the hot alkali spatters on the hands or face. Solution A should be stirred thoroughly when the caustic alkali is added to it; otherwise the heavy caustic solution will sink to the bottom.

Hydroquinone Caustic Soda (Kodak D-8)

Developer for very high contrast on films and plates.

Stock Solution

Water, about 90° F. (32° C.)..	24 oz.	750 c.c.
Sodium sulfite, desiccated....	3 oz.	90 g
Hydroquinone.....	1½ oz.	45 g
Sodium hydroxide (caustic soda) ..	1½ oz.	37.5 g
Potassium bromide....	1 oz.	30 g
Water to make.....	32 oz.	1000 c.c.

Dissolve chemicals in the order given. Stir the solution thoroughly before use.

For use, take 2 parts of stock solution and 1 part of water. Develop about 2 minutes in a tray at 65° F. (18° C.).

For general use, a developer which is slightly less alkaline and gives almost as much density can be obtained by using 410 gr. of sodium hydroxide per 32 oz. of stock solution (28 g per 1000 c.c.) instead of the quantity given in this formula.

Hydroquinone Caustic Soda (Agfa 70)

This developer is recommended for Process film used in reproduction work.

Solution 1

Hot water (125° F. or 52° C.).....	24 oz.	3 qt.	750 c.c.
Hydroquinone ..	368 gr.	3½ oz. 40 gr. (1462 gr.)	25 g
Potassium metabisulfite.	368 gr.	3½ oz. 40 gr. (1462 gr.)	25 g
Potassium bromide	368 gr.	3½ oz. 40 gr. (1462 gr.)	25 g
Cold water.....	32 oz.	1 gal.	1000 c.c.

Solution 2

Cold water.....	32 oz.	1 gal.	1000 c.c.
*Sodium hydroxide (Caustic soda flakes).	1 oz. 90 gr. (528 gr.)	4½ oz. 30 gr. (2108 gr.)	36 g

*May be substituted by:

Potassium hydroxide...	1½ oz. 80 gr. (736 gr.)	6½ oz.	50 g
------------------------	----------------------------	--------	------

Mix equal parts of Solutions 1 and 2 immediately before use. Develop films within 3 minutes at 65° F. (18° C.).

PHOTOGRAPHIC FORMULAE (Continued)

Metol-Hydroquinone (Agfa 90)

This developer has been particularly designed for use with commercial and process films to produce negatives of brilliant contrast.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	75 gr.	294 gr.	5 g
Sodium sulfite, anh.	1½ oz. 40 gr. (587 gr.)	5½ oz.	40 g
Hydroquinone	88 gr.	348 gr.	6 g
Sodium carbonate, mono-hydrated.	1½ oz. 40 gr. (587 gr.)	5½ oz.	40 g
Potassium bromide	45 gr.	179 gr.	3 g
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Normal development time, 4 to 6 minutes at 65° F. (18° C.).

For results of higher contrast, this developer may be modified by the addition of 3 g of potassium bromide per 1000 c.c. of developer (45 gr. per 32 oz.), with developing time of 2 to 3 minutes at 65° F. (18° C.).

Metol-Hydroquinone (Agfa 22)

This formula is recommended for tray or tank development of cine title film and positive film to obtain results of high contrast.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	12 gr.	52 gr.	.8 g
Sodium sulfite, anh	1½ oz.	5 oz.	40 g
Hydroquinone	119 gr.	1 oz. 40 gr. (478 gr.)	8 g
Sodium carbonate, mono-hydrated	1½	7 oz.	50 g
Potassium bromide	75 gr.	299 gr.	5 g
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use. Normal developing time 5 to 8 minutes at 65° F. (18° C.).

FINE GRAIN DEVELOPERS

Elon-Hydroquinone-Borax (Kodak D-76)

For low contrast and greatest shadow detail on panchromatic films and plates.

Water (about 125° F.) (52° C.)	96 oz.	3000 c.c.
Elon	116 gr.	8 g
Sodium sulfite, anh.	13½ oz.	400 g
Hydroquinone	290 gr.	20 g
*Borax	116 gr.	8 g
Water to make	1 gal.	4000 c.c.

*Such as 20-Mule Team Borax.

Use without dilution. For tank use, develop 15 to 25 minutes at 65° F. (18° C.) in the fresh developer according to the contrast desired; for tray use, decrease the time about 20 %. A faster working developer can be obtained by increasing the quantity of borax.

Still finer grained results may be secured by adding potassium bromide to the developer. The maximum quantity which may be added without too great a loss of speed is 300 grains per gallon (20 grams per 4000 c.c.). As bromide is added, it will be necessary

PHOTOGRAPHIC FORMULAE (Continued)

to increase both the time of development and the exposure for best results.

Replenisher Solution			
Water (about 125° F.) (52° C.)	96 oz.	3000 c.c.	
Elon.	175 gr.	12 g	
Sodium sulfite, anh.	13½ oz.	400 g	
Hydroquinone	1 oz.	30 g	
*Borax.	2 oz. 290 gr.	80 g	
Water to make.	1 gal.	4000 c.c.	
*Such as 20-Mule Team Borax.			

Use the replenisher without dilution and add to the tank to maintain the level of the solution.

Fine Grain Developer for Films and Plates (Kodak DK-20)

Water, about 125° F. (52° C)	96 oz.	750 c.c.
Elon.	290 gr.	5 g
Sodium sulfite, desiccated.	13½ oz.	100 g
Kodalk (sodium metaborate, 4H ₂ O)	116 gr.	2 g
Sodium thiocyanate (sulfocyanate)	58 gr.	1 g
Potassium bromide.	29 gr.	.5 g
Cold water to make.	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Average development time about 15 minutes in a tank at 68° F. (20° C.). See individual recommendations listed for each material.

The useful life of this developer can be increased 5 to 10 times by use of the following replenisher.

Replenisher (Kodak DK-20R)			
Water, about 125° F. (52° C.)	96 oz.	750 c.c.	
Elon.	1 oz.	7.5 g	
Sodium sulfite, desiccated.	13½ oz.	100 g	
Kodalk (sodium metaborate 4H ₂ O)	2 oz. 290 gr.	20 g	
	(1165 gr.)		
Sodium thiocyanate (sulfocyanate)	290 gr.	5 g	
Potassium bromide	58 gr.	1 g	
Cold water to make.	1 gal.	1000 c.c.	

Dissolve chemicals in the order given. The replenisher should be added at a rate which will maintain constant development activity.

Metol-Hydroquinone, Automatic System

Two Solutions

A

Water.	1 qt.
Metol.	95 gr.
Sulfite of soda, anh.	750 gr.
Hydroquinone.	95 gr.

B

Saturated solution of borax

To mix solution A take one-half of the water, add the metol and, when dissolved, add one-half of the sulfite. To the other half of the water, hot, add the rest of the sulfite and, when dissolved, add the hydroquinone. Cool and add this second solution to the first, making solution A.

PHOTOGRAPHIC FORMULAE (Continued)

To use pour enough of solution A into a tray to well cover the film or plate, add drops of saturated solution of potassium bromide, enough for the kind of material in use. Some do not require any, others do. Use only enough to keep the whites clear. Soak the film or plate in the A solution for at least two minutes, drain but do not rinse, and then soak in solution B for at least two minutes. Rinse, fix and wash as usual. If a tank is used, the time in each solution must be at least two minutes after the tank is filled. It is necessary to give a full exposure as the high lights cannot be over developed and the shadows will go as far as the exposure will permit. This system gives a gamma of about 0.7 and will be found to produce a very fine negative for enlarging. It is especially good for work in photomicrography.

These solutions are very concentrated and must not be allowed to go below 60° F. They can be used repeatedly and keep well. Results are best at about 70° F., but it makes very little difference between 65° and 80° F.

Metol-Hydroquinone (Agfa 17M)

Fine-Grain Metaborate Tank Developer

This developer is recommended for those who desire a formula similar to Agfa 17, but permitting greater variation in developing time.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	22 gr.	88 gr.	1.5 g
Sodium sulfite, anh. .	2½ oz. 80 gr.	10¼ oz.	80 g
	(1174 gr.)		
Hydroquinone.....	45 gr.	179 gr.	3 g
Sodium metaborate..	30 gr.	119 gr.	2 g
Potassium bromide	7½ gr	30 gr.	.5 g
Water to make ..	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Development time at 65° F. (18° C.), 10 to 15 minutes for fine-grain films.

Larger amounts of sodium metaborate may be used with corresponding reduction of developing time (up to 10 g of sodium metaborate per 1000 c.c. with a developing time of 5 minutes at 65°) although slightly coarser grain size will then be experienced.

Replenisher (Agfa 17M)

Add whenever necessary to keep tank up to full volume.

Hot water (125° F. or 52° C.) ..	24 oz.	3 qt.	750 c.c.
Metol ..	32 gr.	129 gr.	2.2 g
Sodium sulfite, anh. .	2½ oz. 80 gr.	10¼ oz.	80 g
	(1174 gr.)		
Hydroquinone.....	65 gr.	269 gr.	4.5 g
Sodium metaborate. . . .	119 gr.	478 gr.	8 g
Water to make.....	1 qt.	1 gal.	1000 c.c.

Metol-Hydroquinone (Agfa 17)

Fine Grain Borax Tank Developer

In addition to its usefulness as a fine-grain developer, this formula is satisfactory for obtaining soft gradation. It is also recommended for motion picture negative development.

PHOTOGRAPHIC FORMULAE (Continued)

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	22 gr.	88 gr.	1.5 g
Sodium sulfite, anh.....	2½ oz. 80 gr. (1174 gr.)	10¼ oz.	80 g
Hydroquinone.....	45 gr.	179 gr.	3 g
Borax.....	45 gr.	179 gr.	3 g
Potassium bromide.....	7½ gr.	30 gr.	.5 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Development time at 65° F. (18° C.), 10 to 15 minutes for fine-grain films, 12 to 20 minutes for direct copy, direct duplicating, and portrait cut films.

Replenisher (Agfa 17A)

Add whenever necessary to keep tank up to full volume.

Hot water (125° F. or 52° C.).....	24 oz.	3 qt.	750 c.c.
Metol.....	32 gr.	129 gr.	2.2 g
Sodium sulfite, anh..	2½ oz. 80 gr. (1174 gr.)	10¼ oz.	80 g
Hydroquinone..	65 gr.	269 gr.	4.5 g
Borax.....	263 gr.	2½ oz. 75 gr. (1059 gr.)	18 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

Paraphenylene Diamine

Paraphenylene diamine.....	10 g
Sodium sulfite, anh..	60 g
Tribasic sodium phosphate (10 %).	20 c.c.
Potassium bromide (10 %).	10 c.c.
Water.....	1000 c.c.

Develop one hour at 65° F.

Paraphenylene-diamine Glycin

	No. 1	No. 2	No. 3	No. 4
Water.....	32 oz.	32 oz.	32 oz.	32 oz.
Sodium sulfite, dry . . .	3 oz.	3 oz.	3 oz.	3 oz.
Paraphenylene-diamine . .	146 gr.	146 gr.	146 gr.	146 gr.
Glycin.....	15 gr.	88 gr.	175 gr.	

No. 1 gives the finest grain, and requires three to four times normal exposure. The other formulas require about twice normal exposure, develop a film in a shorter time, and give more graininess as the glycin content increases. Formula No. 3 is standard.

LANTERN SLIDE DEVELOPERS

Elon-Hydroquinone (Kodak D-34)

Developer for blue black tones on lantern slide plates.

Stock Solution A

Water (about 125° F.) (52° C.).	16 oz.	500 c.c.
Elon.....	60 gr.	4.2 g
Sodium sulfite, anh.....	½ oz.	15 g
Hydroquinone.....	½ oz.	15 g
Cold water to make..	32 oz.	1000 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

Stock Solution B

Water.....	32 oz.	1000 c.c.
Sodium carbonate, anh.....	$\frac{1}{2}$ oz.	15 g
Potassium bromide.....	30 gr.	2.1 g

For use, take equal parts of A and B.

For softer tones, dilute with an equal volume of water.

Develop $1\frac{1}{2}$ to 3 minutes at 70° F. (21° C.).

Hydroquinone (Kodak D-32)

Developer for warm tones on lantern slide plates.

Stock Solution A

Water, about 125° F. (52° C.).....	16 oz.	500 c.c.
Sodium sulfite, desiccated.....	90 gr.	6.3 g
Hydroquinone.....	100 gr.	7 g
Potassium bromide.....	50 gr.	3.5 g
Citric acid.....	10 gr.	0.7 g
Cold water to make.....	32 oz.	1000 c.c.

Stock Solution B

Cold water.....	32 oz.	1000 c.c.
Sodium carbonate, desiccated.....	1 oz.	30 g
Sodium hydroxide (caustic soda).....	60 gr.	4.2 g

Dissolve chemicals in the order given.

For use, take 1 part of A and 1 part of B. For still warmer tones, 1 part of A and 2 parts of B. Stir thoroughly before use. Develop about 5 minutes in a tray at 68° F. (20° C.).

Maximum Energy Developer (Kodak D-82)

For high speed films or plates.

Water (about 125° F.) (52° C.)...	24 oz.	750 c.c.
Wood alcohol.....	$1\frac{1}{2}$ oz.	48 c.c.
Elon.....	200 gr.	14 g
Sodium sulfite, anh.....	$1\frac{1}{2}$ oz.	52.5 g
Hydroquinone.....	200 gr.	14 g
Sodium hydroxide (caustic soda).....	125 gr.	8.8 g
Potassium bromide.....	125 gr.	8.8 g
Cold water to make.....	32 oz.	1000 c.c.

Develop about four to five minutes at 65° F. (18° C.).

The prepared developer does not keep more than a few days. If wood alcohol is not added and the developer is diluted, the solution is not so active as in the concentrated form. This developer gives the greatest possible density with negatives having a minimum exposure.

Motion Picture Film Developer (Kodak D-79)

Pyro

For negative motion picture film.

Water.....	2.5 qt.	750 c.c.
Sodium sulfite, anh.....	3.3 oz.	25 g
Pyro.....	145.8 gr.	2.5 g
Sodium carbonate, anh.....	291.6 gr.	5 g
Potassium bromide.....	29.2 gr.	0.5 g
Water to make.....	1 gal.	1000 c.c.

Time of development: 9 to 12 minutes at 65° F. (18° C.).

PHOTOGRAPHIC FORMULAE (Continued)

PORTRAIT DEVELOPER

Elon-Hydroquinone (Kodak DK-50)

Developer for professional films and plates.

Stock Solution

Water, about 125° F. (52° C.)	64 oz.	500 c.c.
Elon	145 gr.	2.5 g
Sodium sulfite, desiccated	4 oz.	30 g
Hydroquinone	145 gr.	2.5 g
Kodalk (sodium metaborate (4H ₂ O))	1 oz. 145 gr. (583 gr.)	10 g
Potassium bromide	29 gr.	.5 g
Water to make	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

For tank development of portrait negatives, dilute with an equal volume of water; develop about 9 minutes at 68° F. (20° C.). For tray development, use without dilution; develop about 5 minutes at 68° F. (20° C.).

For commercial work, use without dilution. Develop about 8 minutes in a tank or 6 minutes in a tray at 68° F. (20° C.).

Replenisher (Kodak DK-50R)

Water, about 125° F. (52° C.)	96 oz.	750 c.c.
Elon	290 gr.	5 g
Sodium sulfite, desiccated	4 oz.	30 g
Hydroquinone	1 oz. 145 gr. (583 gr.)	10 g
Kodalk (sodium metaborate 4H ₂ O)	5½ oz.	40 g
Water to make	1 gal.	1000 c.c.

Dissolve chemicals in the order given.

Add to the developer to maintain the activity constant, as described in the instructions for Replenisher DK-20R.

If the developer is diluted 1 to 1 for use, the replenisher should be diluted in the same proportion.

Elon-Hydroquinone (Kodak D-61a)

Developer for professional films and plates.

Stock Solution

Water, about 125° F. (52° C.)	16 oz.	500 c.c.
Elon	45 gr.	3.1 g
Sodium sulfite, desiccated	3 oz.	90 g
Sodium bisulfite	30 gr.	2.1 g
Hydroquinone	85 gr.	5.9 g
Sodium carbonate, desiccated	165 gr.	11.5 g
Potassium bromide	24 gr.	1.7 g
Cold water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

TRAY DEVELOPMENT: Take 1 part of stock solution to 1 part of water. Develop about 6 minutes at 68° F. (20° C.).

PHOTOGRAPHIC FORMULAE (Continued)

TANK DEVELOPMENT: Take 1 part of stock solution and 3 parts of water. Develop about 12 minutes at 68° F. (20° C.). Add stock solution (diluted 1:3) at intervals to maintain the volume, or the replenisher, Kodak D-61R, to maintain the strength of the solution.

Replenisher (Kodak D-61R)

Stock Solution A

Water, about 125° F. (52° C.).....	96 oz.	3000 c.c.
Elon.....	85 gr.	5.9 g
Sodium sulfite, desiccated.....	6 oz.	180 g
Sodium bisulfite.....	55 gr.	3.8 g
Hydroquinone.....	170 gr.	11.9 g
Potassium bromide.....	45 gr.	3.1 g
Cold water to make.....	1½ gal.	6000 c.c.

Stock Solution B

Sodium carbonate, desiccated.....	8 oz.	240 g
Water to make.....	64 oz.	2000 c.c.

Dissolve chemicals in the order given.

For use take 3 parts of A and 1 part of B and add to the tank of developer as needed. Do not mix solutions A and B until ready to use.

Elon-Pyro (Kodak D-7)

For professional films and plates.

Stock Solution A

Water, about 125° F. (52° C.).....	16 oz.	500 c.c.
Elon.....	½ oz.	7.5 g
Sodium bisulfite.....	½ oz.	7.5 g
Pyro.....	1 oz.	30 g
Potassium bromide.....	60 gr.	4.2 g
Water to make.....	32 oz.	1000 c.c.

Stock Solution B

Water.....	32 oz.	1000 c.c.
Sodium sulfite, desiccated.....	5 oz.	150 g

Stock Solution C

Water.....	32 oz.	1000 c.c.
Sodium carbonate, desiccated.....	2½ oz.	75 g

Dissolve chemicals in the order given.

TRAY DEVELOPMENT: Take 1 part of A, 1 part of B, 1 part of C and 8 parts of water. Develop about 7 minutes at 68° F. (20° C.).

TANK DEVELOPMENT: Take 1 part of A, 1 part of B, 1 part of C and 13 parts of water. Develop about 10 minutes at 68° F. (20° C.).

This developer can be used for two or three weeks if the volume is maintained by adding fresh developer in the proportion of 1 part each of A, B, and C to 4 parts of water. It is usually necessary to increase the development time as the developer ages.

PHOTOGRAPHIC FORMULAE (Continued)

POSITIVE FILM DEVELOPER

Metol-Hydroquinone (Agfa 20)

This clean-working developer is recommended for normal contrast with tray or tank development of positive film.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750	c.c.
Metol.....	30 gr.	119 gr.	2	g
Sodium sulfite, anh.....	368 gr.	3½ oz. 40 gr.	25	g
		(1462 gr.)		
Hydroquinone.....	60 gr.	239 gr.	4	g
Sodium carbonate, mono-hydrated.....	269 gr.	2½ oz.	18.5	g
Potassium bromide....	30 gr.	119 gr.	2	g
Water to make.....	32 oz.	1 gal.	1000	c.c.

Do not dilute for use. Normal developing time 3 to 4 minutes at 65° F. (18° C.).

SPEED PROCESSING

Metol-Hydroquinone

Water (cool, 60° F. to 70° F.).....	90	oz.		
Metol.....	1¼ oz. 30 gr.		(796 gr.)	
Sodium sulfite, anh.....	10	oz.		
Hydroquinone.....	3½ oz. 60 gr.		(1591 gr.)	
Sodium hydroxide.....	3½ oz. 60 gr.		(1591 gr.)	
Water to concentration....	(about 112	oz.)		

Dissolve chemicals in the order given, using full strength. Develop 10 seconds in tray at 80° F. Rinse for the same time.

STANDARD DEVELOPERS FOR SENSITOMETRY

Pyro

Hürter and Driffeld standard developer for plate testing:

Pyro.....	8	parts
Sodium sulfite, crystal..	40	parts
Sodium carbonate, crystal	40	parts
Water to make	1000	parts

Paraminophenol

Adopted at Eighth International Congress of Photography

<i>p</i> -Aminophenol hydrochloride	7.25	g
Sodium sulfite, anh.....	50.00	g
Sodium carbonate, anh..	50.00	g
Water to make..	1000.00	c.c.

TROPICAL DEVELOPERS

Metol for Tropical Development of Films and Plates (Kodak DK-15)

Water, about 125° F. (52° C.)....	24	oz.	750	c.c.
Elon.....	82	gr.	5.7	g
Sodium sulfite, desiccated.....	3	oz.	90	g
Kodalk (sodium metaborate 4H ₂ O).	½	oz.	22.5	g
Potassium bromide.....	27	gr.	1.9	g
*Sodium sulfate, desiccated...	1½	oz.	45	g
Cold water to make.....	32	oz.	1000	c.c.

*If it is desired to use crystalline sodium sulfate instead of the desiccated sulfate, then 3½ oz. per 32 oz. (105 g per 1000 c.c.) should be used.

PHOTOGRAPHIC FORMULAE (Continued)

Dissolve chemicals in the order given.

Average time for tank development is about 10 minutes at 68° F. (20° C.) and 2 to 3 minutes at 90° F. (32° C.) in the fresh developer according to the contrast desired. When working *below* 75° F. (24° C.) the sulfate may be omitted if a more rapid formula is required. Development time *without* the sulfate is about 6 minutes at 68° F. (20° C.). Develop about 20 percent less for tray use.

When development is completed, rinse the film or plate in water for 1 or 2 seconds only and immerse in the Tropical Hardener or Hardening Bath SB-4 for 3 minutes (omit water rinse if film tends to soften); then fix for at least 10 minutes in an acid hardening fixing bath, and wash for 10 to 15 minutes in water (not over 95° F.) (35° C.).

Kodak developers make it impossible to produce gas blisters, because Kodak does not evolve a gas when treated with an acid. This is a distinct advantage, especially for summer work, when temperature control of solutions is often difficult.

Developer for Low Contrast Tropical Development of Films and Plates (Kodak DK-15a)

A developer which gives less contrast than Kodak DK-15 can be obtained by reducing the quantity of Kodak to 73 gr. per 32 oz. of developer (5 g per 1000 c.c.).

Development times and processing instructions are the same as for the above developer.

Paraminophenol for Tropical Development

Water (at 125° F.)	96 oz.
Paraminophenol hydrochloride	400 gr.
Sodium sulfite, desiccated	6 oz. 290 gr. (2915 gr.)
Sodium carbonate, desiccated	6 oz. 290 gr. (2915 gr.)
Water to make	1 gal.

Dissolve chemicals in the order given, using full strength. Average time of development 7 to 9 minutes in tray at 65° F., and 3 to 4 minutes at 80° F. If the temperature of the developer is 80° F. or above, add 6 oz. sodium sulfate, desiccated, to 1 gal. of solution.

Metol-Hydroquinone, Rapid (Tropical) Developer (Agfa 64)

This is a clean-working developer of particular value for rapid development or development at high temperatures.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	36 gr.	144 gr.	2.5 g
Sodium sulfite, anh.	368 gr.	3½ oz. 40 gr. (1462 gr.)	25 g
Hydroquinone	95 gr.	383 gr.	6.5 g
Sodium carbonate, mono-hydrated	234 gr.	2 oz. 60 gr. (935 gr.)	16 g
Potassium bromide	15 gr.	60 gr.	1 g
Water to make	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Normal development time—3 to 4 minutes at 65° F. (18° C.).
2 to 3 minutes at 85° F. (29° C.).

PHOTOGRAPHIC FORMULAE (Continued)

UNDEREXPOSURES

Elon-Hydroquinone Developer for Extreme Underexposure (Kodak D-82)

Water, about 125° F. (52° C.).....	24 oz.	750 c.c.
Wood alcohol.....	1½ oz. fl.	48 g
Elon.....	200 gr.	14 g
Sodium sulfite, desiccated.....	1½ oz.	52.5 g
Hydroquinone.....	200 gr.	14 g
Sodium hydroxide (caustic soda).....	125 gr.	8.8 g
Potassium bromide.....	125 gr.	8.8 g
Cold water to make.....	32 gr.	1000 c.c.

Dissolve chemicals in the order given.

Develop about 5 minutes in a tray at 68° F. (20° C.).

The prepared developer does not keep more than a few days in a full bottle or about 2 hours in an open tray. If wood alcohol is omitted and the developer is diluted, the solution is not so active as in the concentrated form.

UNIVERSAL DEVELOPERS

Amidol for Films, Plates or Papers

The following developer will give excellent results for plates, films, lantern slides, bromide paper or gaslight paper. It should be dissolved immediately before using, since it keeps only a few hours in solution.

Amidol.....	25 gr.	1.6 g
Sodium sulfite.....	120 gr.	7.8 g
Water.....	10 oz.	300 c.c.

For lantern slides, bromide paper or gaslight papers add to the above,

Potassium bromide....	7 gr.	0.5 g
-----------------------	-------	-------

The concentration given is satisfactory for any of the purposes mentioned. Develop three to five minutes at a temperature of 65° F. or 18° C.

Elon-Hydroquinone (Kodak D-72)

Stock Solution

Water, about 125° F. (52° C.).....	16 oz.	500 c.c.
Elon.....	45 gr.	3.1 g
Sodium sulfite, desiccated	1½ oz.	45 g
Hydroquinone.....	175 gr.	12 g
Sodium carbonate, desiccated	2½ oz.	67.5 g
Potassium bromide.....	27 gr.	1.9 g
Water to make.....	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

For fast chloride papers such as Velox: stock solution 1 part, water 1 part. Develop 45 seconds at 70° F. (21° C.).

For chloride papers such as Azo: stock solution 1 part, water 2 parts. Develop 45 seconds at 70° F. (21° C.).

PHOTOGRAPHIC FORMULAE (Continued)

For bromide papers: stock solution 1 part, water 4 parts. Develop not less than 1½ minutes at 70° F. (21° C.).

For films and plates: stock solution 1 part, water 1 part and develop about 4 minutes in a tray or 5 minutes in a tank.

Kodolon (Kodak DK-93)

Developer for films, plates, and papers.

Water, about 125° F. (52° C.)	16 oz.	500 c.c.
Kodolon (paraminophenol oxalate)	73 gr.	5 g
Sodium sulfite, desiccated	1 oz.	30 g
Hydroquinone	37 gr.	2.5 g
Kodalk (sodium metaborate 4H ₂ O)	290 gr.	20 g
Potassium bromide	7 gr.	.5 g
Cold water to make	32 oz.	1000 c.c.

Dissolve the chemicals in the order given.

Use without dilution. Develop roll films about 9 minutes in a tank of fresh developer at 68° F. (20° C.). Develop professional films and plates about 6 minutes at 68° F. (20° C.). Greater or less contrast may be obtained by developing longer or shorter times than those specified.

For warm tones on papers, use without dilution and develop for 2 minutes at 68° F. (20° C.). For colder tones, double the quantity of Kodalk; use without dilution and develop 1 to 2 minutes at 68° F. (20° C.). In either case, the tones given with this developer are slightly warmer than the normal tones given with Kodak Developers D-52 and D-72.

The use of Kodak DK-93 is especially recommended for those persons subject to trouble from skin irritation.

Metol-Hydroquinone (Agfa 103)

Universal film and paper developer. This formula may be used both as a developer for film and as a developer for Convira, Speedex and Brovira papers when cold, blue-black tones are desired.

Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol	50 gr.	204 gr.	3.5 g
Sodium sulfite, anh.	1½ oz.	6 oz.	45 g
Hydroquinone	164 gr.	1½ oz.	11.5 g
Sodium carbonate, mono-hydrated	2½ oz. 35 gr. (1129 gr.)	10½ oz.	78 g
Potassium bromide	18 gr.	72 gr.	1.2 g
Water to make	32 oz.	1 gal.	1000 c.c.

FILM DEVELOPMENT: Dilute one part stock solution with two parts water. Normal development time 5 minutes at 65° F. (18° C.).

PAPER DEVELOPMENT: Dilute 1 part stock solution with 2 parts water. For Brovira and similar bromide papers, develop 1 to 1½ minutes at 70° F. (21° C.). For Speedex and Convira (new type) normal development time is 45 seconds. Other contact papers may require 1 to 1½ minutes.

For slower, softer development of Brovira dilute 1 to 4. Develop 1½ to 3 minutes, at 70° F. (21° C.).

PHOTOGRAPHIC FORMULAE (Continued)

X-RAY DEVELOPERS

Elon-Hydroquinone (Kodak D-19b)

Water (about 125° F.) (52° C.).....	16 oz.	500	c.c.
Elon.....	32 gr.	2.2	g
Sodium sulfite, anh.....	2 oz. 175 gr.	72	g
Hydroquinone.....	128 gr.	8.8	g
Sodium carbonate, anh.....	1 oz. 265 gr.	48	g
Potassium bromide.....	60 gr.	4	g
Cold water to make.....	32 oz.	1000	c.c.

Use without dilution. Develop for 5 minutes at 65° F. (18° C.).

Metol-Hydroquinone (Agfa-30)

This developer is recommended when results of maximum brilliance are desired. It is clean-working, has long life and gives high contrast.

Hot water (125° F. or 52° C.)..	24 oz.	3 qt.	750 c.c.
Metol....	50 gr.	204 gr.	3.5 g
Sodium sulfite, anh..	2 oz.	8 oz.	60 g
Hydroquinone.....	129 gr.	1 oz. 80 gr.	9 g
		(517 gr.)	
Sodium carbonate, monohydrated....	1½ oz. 40 gr.		
	(587 gr.)	5½ oz.	40 g
Potassium bromide .	30 gr.	119 gr.	2 g
Water to make . . .	32 oz.	1 gal.	1000 c.c.

Do not dilute for use.

Normal development time at 65° F. (18° C.), for x-ray film, 6 minutes, for non-screen x-ray film, 8 minutes, for direct copy film and direct duplicating film, 4 to 5 minutes, for S. S. Pan-Aero film 10-15 minutes depending upon the type of developing machine.

DESENSITIZERS

Pinakryptol Yellow Desensitizer

Pinakryptol yellow.....	15 gr.	1 g
Water to make.....	32 oz.	1000 c.c.

Use without dilution at a temperature of 65° F. (18° C.). Immerse films in total darkness for two minutes. Orthochromatic film may then be handled in bright red light, panchromatic film in bright green light. Pinakryptol yellow desensitizer should be used as a separate bath and not mixed with the developer.

Use of a 50-50 water alcohol mixture for solution will improve the keeping qualities of the desensitizer.

Pinakryptol Green Desensitizer

This solution is not recommended for high speed panchromatic films.

Stock Solution

Pinakryptol green . . .	15 gr.	1 g
Water to make.....	16 oz.	500 c.c.

For use dilute one part stock desensitizing solution with ten parts water. Immerse films in total darkness for two minutes at 65° F. (18° C.). Development may then be carried out in bright red light.

PHOTOGRAPHIC FORMULAE (Continued)

The same stock solution may be used, if preferred, directly in the developer in the proportion: desensitizer: one part, developer: thirty parts. After two minutes' development in total darkness, bright red light may be used as above.

Use of a 50-50 water-alcohol mixture for solution will improve the keeping qualities of the desensitizer.

DEVELOPERS FOR PAPERS

Amidol (Kodak D-51)

Developer for bromide papers.

Stock Solution

Water (about 125° F.) (52° C.)	24 oz.	750 c.c.
Sodium sulfite, anh.	4 oz.	120 g
Di-aminophenol hydrochloride (amidol)	1½ oz.	37.5 g
Cold water to make	32 oz.	1000 c.c.

For use, take 6 ounces (180 c.c.) stock solution, $\frac{3}{4}$ dram (3 c.c.) 10 % potassium bromide solution, and 24 ounces (750 c.c.) of water. This developer oxidizes rapidly when exposed to the air so that only a quantity sufficient for immediate use should be mixed.

Amidol Paper Developer (Agfa 113)

This formula is intended for tray development only and must be mixed fresh each time. It is recommended only for small lots of prints.

Amidol	96 gr.	6.6 g
Sodium sulfite, anh.	1½ oz. 90 gr. (637 gr.)	44 g
Potassium bromide	8 gr.	.55 g
Water to make	32 oz.	1000 c.c.

Do not dilute for use. If hot water is used for dissolving chemicals, the sodium sulfite and potassium bromide should be dissolved first and the amidol added only after the solution has cooled.

For development of Cykora and similar papers use twice the amount of potassium bromide specified above.

Develop 1 to 2 minutes at 70° F. (21° C.).

Elon-Hydroquinone (Kodak D-52)

Developer for warm tone papers.

Stock Solution

Water, about 125° F. (52° C.)	16 oz.	500 c.c.
Elon	22 gr.	1.5 g
Sodium sulfite, desiccated.	½ oz.	22.5 g
Hydroquinone	90 gr.	6.3 g
Sodium carbonate, desiccated	½ oz.	15 g
Potassium bromide	22 gr.	1.5 g
Cold water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

For use, take 1 part of stock solution to 1 part of water. Develop about 2 minutes at 68° F. (20° C.).

More bromide may be added if warmer tones are desired.

PHOTOGRAPHIC FORMULAE (Continued)

Glycin-Hydroquinone Developer (Agfa 115)

This is a warm-tone developer suitable for Cykron, Cykora, Indiatone, Brovira, and similar papers.

Stock Solution				
Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750	c.c.
Sodium sulfite, anh.....	3 oz.	12 oz.	90	g
Sodium carbonate, monohydrated.....	5 oz.	1 lb. 4 oz.	150	g
Glycin	1 oz.	4 oz.	30	g
Hydroquinone.....	139 gr.	1½ oz. 10 gr. (557 gr.)	9.5	g
Potassium bromide.....	60 gr.	239 gr.	4	g
Water to make.....	32 oz.	1 gal.	1000	c.c.

For warm tones, dilute 1 part stock solution with 3 parts water and develop prints 2½ to 3 minutes at 70° F. (21° C.).

For very warm tones and more open shadows, especially with Cykora, dilute 1 part stock solution with 6 parts water, giving prints 3 to 4 times normal exposure and 2½ to 5 minutes development. Because of dilution of the developer, solution will exhaust more rapidly and will require more frequent replacement.

Hydroquinone (Agfa 110)

Direct brown-black paper developer. Beautiful warm tones may be obtained with this developer on both contact and projection papers.

Stock Solution				
Hot water (125° F. or 52° C.).....	24 oz.	3 qt.	750	c.c.
Hydroquinone.....	3 oz.	3 oz.	22.5	g
Sodium sulfite, anh. . .	1¾ oz. 50 gr. (816 gr.)	7½ oz.	57	g
Sodium carbonate, monohydrated.....	2½ oz.	10 oz.	75	g
Potassium bromide.....	40 gr.	159 gr.	2.75	g
Water to make.....	32 oz.	1 gal.	1000	c.c.

For use dilute 1 part stock solution with 5 parts water.

Give prints 3 to 4 times normal exposure and develop 5 to 7 minutes at 70° F. (21° C.).

Metol (Agfa 120)

This is a soft-working developer, primarily intended for portrait work where soft gradation is required.

Stock Solution				
Hot water (125° F. or 52° C.).....	24 oz.	3 qt.	750	c.c.
Metol.....	179 gr.	1½ oz. 60 gr. (716 gr.)	12.3	g
Sodium sulfite, anh.....	1 oz. 88 gr. (526 gr.)	4¾ oz.	36	g
Sodium carbonate, monohydrated.....	1 oz. 88 gr. (526 gr.)	4¾ oz.	36	g
Potassium bromide. . .	27 gr.	½ oz.	1.8	g
Water to make....	32 oz.	1 gal.	1000	c.c.

PHOTOGRAPHIC FORMULAE (Continued)

For use, dilute 1 part stock solution with 2 parts water.
Normal developing time, $1\frac{1}{2}$ to 3 minutes at 70° F. (21° C.).

Metol-Hydroquinone (Agfa 135)

This developer is recommended for rich, warm-black tones with Cykon, Convira, Cykora, Brovira, Indiatone and similar papers.

Stock Solution			
Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	24 gr.	96 gr.	1.6 g
Sodium sulfite, anh....	348 gr.	3½ oz.	24 g
Hydroquinone.....	96 gr.	388 gr.	6.6 g
Sodium carbonate, monohydrated.	348 gr.	3½ oz.	24 g
Potassium bromide.....	40 gr.	159 gr.	2.8 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

For use, dilute 1 part stock solution with 1 part water. A properly exposed print will be fully developed at 70° F. (21° C.) in about $1\frac{1}{2}$ to 2 minutes. Complete development may be expected to take slightly longer with rough-surfaced papers than with semi-glossy or luster-surfaced papers. For greater softness, dilute the bath with water up to equal quantities of developer and water. To increase the warmth, add bromide up to double the amount in the formula. The quantity of bromide specified in the formula, however, assures rich, warm, well-balanced tones.

Metol-Hydroquinone (Agfa 130)

This formula is a universal developer for all projection and contact papers. It gives rich black tones with excellent brilliance and detail. It provides unusual latitude in development and is clean-working even with long developing times.

Stock Solution			
Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	32 gr.	129 gr.	2.2 g
Sodium sulfite, anh	1½ oz.	6½ oz.	50 g
Hydroquinone.....	159 gr.	1½ oz.	11 g
Sodium carbonate, monohydrated	2½ oz.	10½ oz.	78 g
Potassium bromide.....	80 gr.	3½ oz.	5.5 g
Glycin....	159 gr.	1½ oz.	11 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

The prepared stock solution is clear but slightly colored. The coloration in this case does not indicate the developer has deteriorated or is unfit for use.

For use dilute 1 part stock solution with 1 part water.

Normal developing time at 70° F. (21° C.) for Brovira, 2 to 6 minutes, for Convira and Indiatone, $1\frac{1}{2}$ to 3 minutes.

Greater contrast can be obtained by using the developer stock solution full strength. Softer results can be obtained by diluting 1 part stock solution with 2 parts water.

Metol-Hydroquinone (Agfa 125)

This formula is recommended for development of Cykon, Cykora, Brovira and similar papers. It can also be used as recommended below for the rapid development of press films.

PHOTOGRAPHIC FORMULAE (Continued)

Stock Solution			
Hot water (125° F. or 52° C.)	24 oz.	3 qt.	750 c.c.
Metol.....	45 gr.	179 gr.	3 g
Sodium sulfite, anh.....	1½ oz.	6 oz.	44 g
Hydroquinone.....	169 gr.	1½ oz. 20 gr.	12 g
		(676 gr.)	
Sodium carbonate, mono-hydrated.....	2½ oz.	9 oz.	65 g
Potassium bromide.....	30 gr.	119 gr.	2 g
Water to make.....	32 oz.	1 gal.	1000 c.c.

PAPER DEVELOPMENT: Dilute 1 part stock solution with 2 parts water. Develop 1 to 2 minutes at 70° F. (21° C.). For softer and slower development dilute 1 to 4, and develop 1½ to 3 minutes at 70° F. (21° C.). For greater brilliance, shorten the exposure slightly and lengthen the development time. For greater softness, lengthen the exposure slightly and shorten the development time.

RINSING, HARDENING AND FIXING BATHS

Rinsing Bath or Short Stop

After development rinse prints (or negatives) for five seconds before fixing.

Water.....	32 oz.	1000 c.c.
Acetic acid (glacial)...	0.5 oz.	6 c.c.

Stop Bath (Kodak SB-1)

For papers.

Water.....	32 oz.	1000 c.c.
Acetic acid, 28 %.....	1½ oz.	48 c.c.

To make approximately 28 % acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

Rinse prints for at least 5 seconds. Capacity: about 20 8 × 10-inch prints per quart (1000 c.c.).

Stop Bath (Kodak SB-1a)

For films, plates, and papers for graphic arts.

Water.....	32 oz.	1000 c.c.
Acetic acid, 28 %.....	4 oz.	125 c.c.

To make approximately 28 % acetic acid from glacial acetic acid, dilute three parts of glacial acetic acid with eight parts of water.

The action of this bath checks development instantly, provided the acid has not been neutralized. It also tends to prevent uneven spots and streaks when the prints or negatives are immersed in the fixing bath.

Hardening Bath (Kodak SB-3)

For use at 65° to 75° F. with films and plates.

Water.....	32 oz.	1000 c.c.
Potassium chrome alum.....	1 oz.	30 g

This bath is intended for use in hot weather after development and before fixation in conjunction with Kodak Fixing Bath F-5.

PHOTOGRAPHIC FORMULAE (Continued)

Agitate the negatives for a few seconds when first immersed in hardener. Leave them in the bath for 3 to 5 minutes to secure maximum hardening. This bath should be renewed frequently.

Hardening Bath (Kodak SB-4)

For use at 75° to 90° F. with films and plates.

This solution is recommended for use in conjunction with the High Temperature Developer (Kodak DK-15), when working above 75° F. (24° C.).

Water.....	32 oz.	1000 c.c.
Potassium chrome alum.....	1 oz.	30 g
*Sodium sulfate, desiccated.....	2 oz.	60 g

*If crystalline sodium sulfate is preferred instead of the desiccated, use 4½ oz. (140 g) in the above formula.

Agitate the negatives for 30 to 45 seconds when they are first immersed in the hardener, or streakiness will result. Leave them in the bath for at least 3 minutes between development and fixation. If the temperature is below 85° F. (29° C.), rinse for 1 to 2 seconds in water before immersing in the hardener bath.

The hardening bath is a violet blue color by tungsten light when freshly mixed, but it ultimately turns a yellow-green with use; it then ceases to harden and should be replaced with a fresh bath. The hardening bath should never be overworked. An unused bath will keep indefinitely, but the hardening power of a partially used bath decreases rapidly on standing for a few days.

Formaldehyde Hardener (Kodak SH-1)

For after treatment of films and plates.

Water.....	16 oz.	500 c.c.
Formaldehyde (about 37 % solution by weight).....	2½ dr.	10 c.c.
Sodium carbonate, desiccated.....	73 gr.	5 g
Water to make.....	32 oz.	1000 c.c.

This formula is recommended for the treatment of negatives which normally would be softened by a chemical treatment as for the removal of stains or for intensification or reduction.

After hardening for three minutes, negatives should be rinsed and immersed for five minutes in a fresh acid fixing bath and then washed thoroughly before they are given any further chemical treatment.

Plain Non-hardening Fixing Bath

Water.....	32 oz.	852 c.c.
Hypo (sodium thiosulfate).....	8 oz.	227 g

Do not use the bath when it is discolored; it must be made fresh each day.

Non-Hardening Metabisulfite Fixer (Agfa 203)

This fixing bath is recommended for use when hardening is not desired. It is highly desirable for accuracy of registration in color work with Reprolith Film.

Stock Solution

Hypo.....	4 lb.	1900 g
Potassium metabisulfite.....	9 oz.	270 g
Water to make.....	1 gal.	4000 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

The metabisulfite should be added only when the hypo solution is cool.

For use dilute one part stock solution with one part water. Normal fixing time 5 to 10 minutes at 65° F. (18° C.).

Fixing Bath Non-Hardening; For Special Processes (Kodak F-24)

Water, about 125° F. (52° C.)..	16 oz.	500 c.c.
Sodium thiosulfate (hypo)	8 oz.	240 g
Sodium sulfite, desiccated	145 gr.	10 g
Sodium bisulfite...	365 gr.	25 g
Cold water to make	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

This bath may be used for films, plates or paper when no hardening is desired.

For satisfactory use, the temperature of the developer, rinse bath, and wash water should not be higher than 68° F. (20° C.).

Acid Hardening Fixer (Agfa 201)

This hardening fixing bath for use with either film or paper may be stored indefinitely and used repeatedly until exhausted. If the fixing bath froths, turns cloudy, or takes longer than 10 minutes to fix out completely, it must be replaced by a fresh solution.

Solution 1			
Hot water (125° F. or 52° C.)	16 oz.	$\frac{1}{2}$ gal.	500 c.c.
Hypo	8 oz.	2 lb.	240 g
Solution 2			
Hot water (125° F. or 52° C.)	5 oz.	20 oz.	150 c.c.
Sodium sulfite, anh	$\frac{1}{2}$ oz.	2 oz.	15 g
Acetic acid (28 %)	1 $\frac{1}{2}$ oz.	6 oz.	45 c.c.
Potassium alum	$\frac{1}{2}$ oz.	2 oz.	15 g
Add solution 2 to 1 and add water to make	32 oz.	1 gal.	1000 c.c.

Dissolve chemicals thoroughly in order given and stir rapidly while adding solution 2 to solution 1. Glacial acetic acid may be diluted to 28 % concentration by adding 3 parts of acid to 8 parts of water. Do not dilute for use. Normal fixing time 5 to 10 minutes at 65° to 70° F. (18° to 21° C.).

Acid Hardening Fixing Bath (Kodak F-5)

For films, plates, and papers.

Water, about 125° F. (52° C.)	20 oz.	600 c.c.
Sodium thiosulfate (hypo)...	8 oz.	240 g
Sodium sulfite, desiccated	$\frac{1}{2}$ oz.	15 g
*Acetic acid, 28 %	1 $\frac{1}{2}$ oz. fl.	48 c.c.
Boric acid, crystals	$\frac{1}{2}$ oz.	7.5 g
Potassium alum...	$\frac{1}{2}$ oz.	15 g
Cold water to make...	32 oz.	1000 c.c.

*To make approximately 28 % acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Films or plates should be fixed properly in 10 to 20 minutes in a freshly prepared bath. The bath need not be discarded until the fixing time exceeds 20 minutes.

PHOTOGRAPHIC FORMULAE (Continued)

This bath has the advantage over the older type of fixing baths, which do not contain boric acid, that it gives much better hardening and has less tendency to precipitate a sludge of aluminum sulfite.

Acid Fixing Bath for Papers

(May also be used for plates or films)

Water.....	64 oz.
Hypo.....	16 oz.

Dissolve, then add the following acid hardener:

Water.....	5 oz.
Sodium sulfite, anh.	$\frac{1}{2}$ oz.
Acetic acid, 25 %.. . . .	3 oz.
Alum, anh.....	$\frac{1}{2}$ oz.

This fixing bath is also excellent for dry plates and films, and will keep indefinitely before using; therefore it can be made up some time in advance. One pint of the bath should fix at least fifty 4 × 5 prints. The acid fixing bath can be used repeatedly. It keeps with but little care. It will by degrees become alkaline by the gradual addition of developer adhering to the prints. It should be discarded entirely when it becomes frothy, and a fresh bath prepared.

Rapid Fixing Bath for General Photographic Use (Kodak F-7)

Water, about 125° F. (52° C.).	80 oz.	600 c.c.
Sodium thiosulfate (hypo)	3 lb.	360 g
Ammonium chloride.	6 $\frac{1}{2}$ oz.	50 g
Sodium sulfite, desiccated...	2 oz.	15 g
*Acetic acid, 28 %.. . . .	6 oz. fl.	48 c.c.
Boric acid, crystals.	1 oz.	7.5 g
Potassium alum.	2 oz.	15 g
Cold water to make.. . . .	1 gal.	1000 c.c.

* To make approximately 28 % acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Dissolve chemicals in the order given.

Chrome Alum Fixing Bath for Films and Plates (Kodak F-16)

Solution A

Sodium thiosulfate (hypo)....	2 lb.	960 g
Sodium sulfite, desiccated.. . . .	2 oz.	60 g
Water to make.....	96 oz.	3000 c.c.

Solution B

Water.....	32 oz.	1000 c.c.
Potassium chrome alum.....	2 oz.	60 g
Sulfuric acid.....	$\frac{1}{2}$ oz. fl.	8 c.c.

Caution: Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid: otherwise the solution may boil and spatter the acid on the hands or face, causing serious burns.

Pour solution B into solution A slowly while stirring A rapidly. This bath, when freshly mixed, is recommended for use in hot weather, but it rapidly loses its hardening properties with or without use, when it should be replaced by a fresh bath. With an old bath there is a tendency for scum to form on the surface of the film. Any such scum should be removed by swabbing with cotton before the film is dried. It is not advisable to use this bath in metal tanks.

PHOTOGRAPHIC FORMULAE (Continued)

Hypo Eliminator

Water	16 oz.
Hydrogen peroxide (3 percent)	4 oz. fl.
Ammonia (3 percent)	3½ oz. fl.
Water to make	32 oz.

Directions for use: Wash prints for 30 minutes at 65° F. Immerse each print for 6 minutes in hypo eliminator solution, then wash for 10 minutes and dry. Capacity of bath is about fifty 8 × 10 prints or the equivalent per gallon.

Hypo Test Solution

Water (cool, 60° F. to 70° F., preferably distilled).....	8 oz.
Potassium permanganate.....	4 gr.
Sodium hydroxide.....	8 gr.

Use ½ dr. (15 drops) of above solution to 8 oz. of water, preferably distilled. Pour ½ oz. of this solution in small graduate. Take equivalent of six 4 × 6 inch prints from water, drain hurriedly, and allow drippings to drip into the ½ oz. of solution for 30 seconds. The least trace of hypo in the water draining from the prints will cause this violet solution to turn to an orange color. If more hypo is present in the drippings, the solution will change to a greenish-yellow color. As certain impurities in water will cause similar discoloration of the solution, a number of drops of tap water, equivalent to number of drops to be dropped from prints, should be dropped into the ½ oz. of violet-colored solution. If no change in color takes place, any change in color that will take place from the water drained from prints will be due to the presence of hypo which will prove that the prints have not been sufficiently washed.

STAIN REMOVERS

Hand Stain Remover (Kodak S-5)

Solution A

Potassium permanganate	1 oz.	7.5 g
Water	32 oz.	1000 c.c.

Solution B

Sodium bisulfite	16 oz.	480 g
Water.. . . .	32 oz.	1000 c.c.

Rub the hands with a small amount of solution A, rinse in water; then pour a small quantity of solution B into the palm of one hand, rub it quickly over the hands, and, when free of stain, wash them thoroughly with water. If the original stain is not entirely removed, repeat the treatment with solutions A and B.

If it is desired to immerse the hands in solution B, 1 part of the solution should be diluted with 4 parts of water.

Stain Remover for Removal of Developer Stain on Negatives (Kodak S-6)

Developer or oxidation stain may be removed by first hardening the film for 2 or 3 minutes in the formalin hardener then washing for 5 minutes and bleaching in:

Stock Solution A

Potassium permanganate.....	75 gr.	5.2 g
Water to make.. . . .	32 oz.	1000 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

Stock Solution B

Cold water.....	16 oz.	500	c.c.
Sodium chloride.....	2½ oz.	75	g
Sulfuric acid.....	½ oz.	16	c.c.
Water to make	32 oz.	1000	c.c.

Caution: Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid; otherwise the solution may boil and spatter the acid on the hands or face, causing serious burns.

Use equal parts of A and B. The solutions should not be mixed until ready for immediate use since they do not keep long after mixing. All particles of permanganate should be dissolved completely when preparing solution A, since undissolved particles are likely to produce spots on the negative. Bleaching should be complete in 3 or 4 minutes at 68° F. (20° C.). The brown stain of manganese dioxide formed in the bleach bath is best removed by immersing the negative in 1% sodium bisulfite solution. Then rinse well and develop in strong light, preferably sunlight, with any general purpose developer. Then wash thoroughly.

Iron Clearing Solution

To remove yellow stain caused by pyro or hydroquinone developer, wash well to free from hypo and place in

Water.....	20 oz.	568	c.c.
Ferrous sulfate, pure ..	3 oz.	85	g
Sulfuric acid, C. P ..	1 oz.	28	g
Powdered alum ..	1 oz.	28	g

until stain is gone, then wash well.

INTENSIFIERS

Mercury Intensifier for Films and Plates (Kodak In-1)

BLEACH the negative in the following solution until it is white, *then wash thoroughly.*

Potassium bromide	¾ oz.	22.5	g
Mercuric chloride	¾ oz.	22.5	g
Water to make	32 oz.	1000	c.c.

The negative can be blackened with 10% sulfite solution, a developing solution, or 10% ammonia (1 part concentrated ammonia (28%) to 9 parts water), these giving progressively greater density in the order given.

Chromium Intensifier for Films and Plates (Kodak In-4)

Stock Solution

Potassium bichromate....	3 oz.	90	g
Hydrochloric acid ..	2 oz. fl.	64	c.c.
Water to make ..	32 oz.	1000	c.c.

For use, take 1 part of stock solution to 10 parts of water.

Harden the negative first in a formaldehyde hardening solution. Bleach thoroughly at 65° to 70° F. (18° to 21° C.), then wash five minutes and redevelop fully in artificial light or daylight (not sunlight) in any quick-acting, non-staining developer which does not contain an excess of sulfite; for example, about 10 minutes at 68° F. (20° C.) in any general purpose developer. Developers containing a high proportion of sodium sulfite should be avoided.

PHOTOGRAPHIC FORMULAE (Continued)

Then rinse, fix for five minutes, and wash thoroughly. Greater intensification can be secured by repeating the process. Negatives intensified with chromium are more permanent than those intensified with mercury.

Silver Intensifier for Films and Plates (Kodak In-5)

The following formula is the only intensifier known that will not change the color of the image on positive film on projection. It gives proportional intensification and is easily controlled by varying the time of treatment. The formula is equally suitable for positive and negative film.

Stock Solution No. 1 (Store in brown bottle)

Silver nitrate, crystals.....	2 oz.	60 g
Distilled water to make.....	32 oz.	1000 c.c.

Stock Solution No. 2

Sodium sulfite, desiccated.....	2 oz.	60 g
Water to make.....	32 oz.	1000 c.c.

Stock Solution No. 3

Sodium thiosulfate (hypo).....	3½ oz.	105 g
Water to make.....	32 oz.	1000 c.c.

Stock Solution No. 4

Sodium sulfite, desiccated.....	½ oz.	15 g
Elon.....	350 gr.	24 g
Water to make.....	96 oz.	3000 c.c.

Prepare the intensifier solution for use as follows: Slowly add 1 part of solution No. 2 to 1 part of solution No. 1, shaking or stirring to obtain thorough mixing. The white precipitate which appears is then dissolved by the addition of 1 part of solution No. 3. Allow the resulting solution to stand a few minutes until clear. Then add, with stirring, 3 parts of solution No. 4. The intensifier is then ready for use and the film should be treated immediately. The mixed intensifier solution is stable for approximately 30 minutes at 68° F. (20° C.).

The degree of intensification obtained depends upon the time of treatment which should not exceed 25 minutes. After intensification, immerse the film for 2 minutes with agitation in a plain 30 % hypo solution. Then wash thoroughly.

The stability of the mixed intensifier solution and the rate of intensification are very sensitive to changes in the thiosulfate concentration. A more active but less stable working solution may be obtained by using a stock solution No. 3 prepared with 3 oz. of hypo per 32 oz. (90 g per 1000 c.c.) instead of the quantity in the formula. The directions for preparing the working solution are the same as before but the mixed intensifier will not keep over 20 minutes at 68° F. (20° C.).

For best results, the intensifier should be used in artificial light; the solution tends to form a precipitate of silver quite rapidly when exposed directly to sunlight.

REDUCERS

Farmer's Reducer, Proportional, for Lowering Contrast (Kodak R-4b)

Farmer's Reducer also may be used as a two-bath formula by treating the negative in the ferricyanide solution first and sub-

PHOTOGRAPHIC FORMULAE (Continued)

sequently in the hypo solution. This method gives almost proportional reduction and corrects for overdevelopment. The single solution Farmer's Reducer gives only cutting reduction and corrects for overexposure.

Solution A

Potassium ferricyanide.....	1 oz.	7.5 g
Water to make.....	32 oz.	1000 c.c.

Solution B

Sodium thiosulfate (hypo).....	6½ oz.	200 g
Water to make.....	32 oz.	1000 c.c.

Treat the negatives in solution A with uniform agitation for 1 to 4 minutes at 65-70° F. (18-20° C.) depending on the degree of reduction desired. Then immerse them in solution B for 5 minutes and wash thoroughly. The process may be repeated if more reduction is desired. For the reduction of general fog, one part of solution A should be diluted with one part of water.

Farmer's Reducer (Agfa 310)

This is a cutting reducer for lessening the density of heavy negatives and at the same time increasing their contrast. It is especially valuable for reproduction films to clear the whites.

Solution 1

Hypo.....	8 oz.	240 g
Water to make.....	32 oz.	1000 c.c.

Solution 2

Potassium ferricyanide ...	274 gr.	19 g
Water to make....	8 oz.	250 c.c.

For use mix one part solution 2 and four parts solution 1 in 32 parts water. Solutions 1 and 2 should be stored separately and mixed immediately before use.

Flattening Reducer (Agfa 311)

This reducer is useful for lessening the density and contrast of heavy negatives.

Solution 1

Potassium ferricyanide.....	1 oz. 75 gr. (513 gr.)	35 g
Potassium bromide.....	149 gr.	10 g
Water to make....	32 oz.	1000 c.c.

Bleach in solution 1 and after thorough washing, redevelop to desired density and contrast in any except fine-grain developers. Then fix and wash in usual manner. Conduct operation in subdued light.

Farmer's Reducer for Amateur Use for Clearing Shadow Areas (Kodak R-4)

Solution A

Water.....	1 oz.	32 c.c.
Potassium ferricyanide..	15 gr.	1 g

Solution B

Water.....	32 oz.	1000 c.c.
Sodium thiosulfate (hypo).....	1 oz.	30 g

PHOTOGRAPHIC FORMULAE (Continued)

Add A to B and immediately pour over the negative to be reduced. The reducer solution decomposes rapidly after mixing together the A and B solutions and therefore should be used at once. When the negative has been reduced sufficiently, wash thoroughly before drying. Local areas may be reduced by applying the solution with a cotton pad.

Reducer for Clearing Shadow Areas (Kodak R-2)

Stock Solution A

Water.....	32 oz.	1000 c.c.
Potassium permanganate.....	1½ oz.	52.5 g

Stock Solution B

Water.....	32 oz.	1000 c.c.
Sulfuric acid.....	1 oz. fl.	32 c.c.

Caution: Always add the sulfuric acid to the water slowly stirring constantly, and never the water to the acid; otherwise the solution may boil and spatter the acid on the hands or face causing serious burns.

The best method of dissolving the permanganate crystals in solution A is to use a small volume of hot water (about 180° F.) (82° C.) and shake or stir the solution vigorously until completely dissolved; then dilute to volume with cold water.

The negative must be thoroughly washed to remove all traces of hypo before it is reduced. For use, take 1 part A, 2 parts B and 64 parts of water. When the negative has been reduced sufficiently, place it in a fresh acid fixing bath for a few minutes, to remove yellow stains, then wash thoroughly.

If reduction is too rapid, use a larger volume of water when diluting the solution for use. This solution should *not be used* as a stain remover as it has a tendency to attack the image before it removes the stain.

The two solutions should not be combined until immediately before use. They will not keep long in combination.

Proportional Reducer for Lowering Contrast (Kodak R-5)

Stock Solution A

Water.....	32 oz.	1000 c.c.
Potassium permanganate.....	4 gr.	.3 g.
Sulfuric acid (10 % solution).....	½ oz. fl.	16 c.c.

Stock Solution B

Water.....	96 oz.	3000 c.c.
Ammonium persulfate.....	3 oz.	90 g

To make a 10 % solution of sulfuric acid, take 1 part of sulfuric acid and add it to 9 parts of water, slowly with stirring. *Never add the water to the acid* because the solution may boil and spatter the acid on the hands or face, causing serious burns.

For use, take one part of solution A to three parts of solution B. When sufficient reduction is secured, the negative should be cleared

PHOTOGRAPHIC FORMULAE (Continued)

in a 1 % solution of sodium bisulfite. Wash the negative thoroughly before drying.

Semi-Proportional Reducer for Lowering Contrast and Clearing Shadow Areas (Kodak R-8)

This is the only single solution which keeps well in a tank.

Water, about 125° F. (52° C.).....	24 oz.	750 c.c.
Ferric chloride.....	365 gr.	25 g
Potassium citrate.....	2½ oz.	75 g
Sodium sulfite, desiccated.....	1 oz.	30 g
Citric acid.....	290 gr.	20 g
Sodium thiosulfate (hypo).....	6½ oz.	200 g
Water to make.....	32 oz.	1000 c.c.

Dissolve chemicals in the order given.

Use full strength for maximum rate of reduction. Treat negatives 1 to 10 minutes at 65° to 70° F. (18° to 21° C.). Then wash thoroughly. If a slower action is desired, dilute one part of solution with one part of water. The reducer is especially recommended for the treatment of dense, contrasty negatives.

Super-Proportional Reducer for Great Reduction of Contrast (Kodak R-1)

Water.....	32 oz.	1000 c.c.
Ammonium persulfate.	2 oz.	60 g
Sulfuric acid	1 dr.	3 c.c.

Caution: Always add the sulfuric acid to the solution slowly, stirring constantly, and never the solution to the acid; otherwise the solution may boil and spatter the acid on the hands or face causing serious burns.

For use, take 1 part stock solution and 2 parts water.

Treat the negative in a formaldehyde hardener solution and wash thoroughly before reduction. When reduction is complete, immerse in an acid fixing bath for a few minutes and wash thoroughly before drying. If reduction is too rapid, dilute the solution with a further volume of water.

TONING FORMULAE

Hypo Alum Toner (Agfa²²²)

This toner is recommended for beautiful reddish-brown tones.

Solution 1

Water.. . . .	80 oz.	2350 c.c.
Hypo.. . . .	15 oz.	450 g

Solution 2

Water.. . . .	1 oz.	30 c.c.
Silver nitrate.....	20 gr.	1.3 g

Solution 3

Water.. . . .	1 oz.	30 c.c.
Potassium iodide.....	40 gr.	2.7 g

Add solution 2 to solution 1. Then add solution 3 to the mixture. Finally add 105 grams (3½ oz.) of potassium alum to this solution, and heat the entire bath to the boiling point or until sulfurization

PHOTOGRAPHIC FORMULAE (Continued)

takes place (indicated by a milky appearance of the solution). Tone prints 20 to 60 minutes in this bath at 110–125° F. (43–52° C.). Agitate prints occasionally until toning is complete. Care should be taken to see that the blacks are fully converted before removing the prints from the toning bath, otherwise double tones may result.

Hypo Alum Sepia Toner for Papers (Kodak T-1a)

Cold water.	90 oz.	2800	c.c.
Sodium thiosulfate (hypo)....	16 oz.	480	g

Dissolve thoroughly, and add the following solution:

Hot water, about 160° F. (70° C.)...	20 oz.	640	c.c.
Potassium alum	4 oz.	120	g

Then add the following solution (including precipitate) *slowly to the hypo-alum solution while stirring the latter rapidly.*

Cold water.	2 oz.	64	c.c.
Silver nitrate, crystals	60 gr.	4.2	g
Sodium chloride.	60 gr.	4.2	g

After combining above solutions,

Add water to make	1 gal.	4000	c.c.
-----------------------------	--------	------	------

Note: The silver nitrate should be dissolved completely before adding the sodium chloride and immediately afterward, the solution containing the milky white precipitate should be added to the hypo-alum solution as directed above. The formation of a black precipitate in no way impairs the toning action of the bath if proper manipulation technique is used.

For use, pour into a tray supported in a water bath and heat to 120° F. (49° C.). At this temperature prints will tone in 12 to 15 minutes depending on the type of paper. Never use the solution at a temperature above 120° F. (49° C.). Blisters and stains may result. Toning should not be continued longer than 20 minutes at 120° F. (49° C.).

In order to produce good sepia tones, the prints should be exposed so that the print is slightly darker than normal when developed normally (1½ to 2 minutes).

The prints to be toned should be fixed thoroughly and washed for a few minutes before being placed in the toning bath. Dry prints should be soaked thoroughly in water. To insure even toning, the prints should be immersed completely, and separated occasionally, especially during the first few minutes.

After prints are toned, they should be wiped with a soft sponge and warm water to remove any sediment, and washed for one hour in running water.

Sulfide Sepia for Papers (Kodak T-7a)

Stock Bleaching Solution A

Potassium ferricyanide.	2½ oz.	75	g
Potassium bromide.	2½ oz.	75	g
Potassium oxalate.	6½ oz.	195	g
Acetic acid, 28 %	1¼ oz. fl.	40	c.c.
Water.	64 oz.	2000	c.c.

PHOTOGRAPHIC FORMULAE (Continued)

To make approximately 28 % acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with 8 parts of water.

Stock Toning Solution B

Sodium sulfide (not sulfite).....	1½ oz.	45 g
Water.....	16 oz.	500 c.c.

Prepare bleaching bath as follows:

Stock solution A.....	16 oz.	500 c.c.
Water.....	16 oz.	500 c.c.

Prepare toner as follows:

Stock solution B.....	4 oz.	125 c.c.
Water to make.....	32 oz.	1000 c.c.

Stock hardener solution (Kodak F-1a)

Water, about 125° F. (52° C.).....	14 oz.	425 c.c.
Sodium sulfite, desiccated.....	2 oz.	60 g
Acetic acid, 28 %.....	6 oz. fl.	190 c.c.
Potassium alum.....	2 oz.	60 g
Cold water to make.....	32 oz.	1000 c.c.

To make approximately 28 % acetic acid from glacial acetic acid, dilute 3 parts of glacial acetic acid with eight parts of water.

Dissolve the chemicals in the order given. The sodium sulfite should be dissolved completely before the acetic acid is added. After the sulfite-acid solution has been mixed thoroughly, add the potassium alum with constant stirring.

The print to be toned should first be washed thoroughly. Place it in the bleaching bath, and allow it to remain until only faint traces of the halftones are left and the black of the shadows has disappeared. This operation will take about one minute.

Note: Particular care should be taken *not* to use trays with any iron exposed, otherwise blue spots may result.

Rinse *thoroughly* in clean cold water.

Place in toner solution until original detail returns. This will require about 30 seconds. Give the print an immediate and thorough water rinse; then immerse it for five minutes in a hardening bath composed of 1 part of the stock hardener Kodak F-1a and 16 parts of water. The color and gradation of the finished print will not be affected by the use of this hardening bath. Remove the print from the hardener bath and wash for one-half hour in running water.

Sepia Toner (Agfa 221)

This toner is recommended for warm-brown sepia tones.

Solution 1

Hot water (125° F. or 52° C.).....	24 oz.	750 c.c.
Potassium ferricyanide.....	1½ oz. 80 gr. (736 gr.)	50 g
Potassium bromide.....	144 gr.	10 g
Sodium carbonate, monohydrated.....	289 gr.	20 g
Water to make.....	32 oz.	1000 c.c.

Solution 2

Sodium sulfide.....	1½ oz.	45 g
Water to make.....	16 oz.	500 c.c.

PHOTOGRAPHIC FORMULAE (Continued)

For use as described below, dilute one part solution 2 with eight parts water. **IMPORTANT**—Be sure to use sodium sulfide, not sodium sulfite, in compounding the re-developer. Also, use clean trays, free from exposed iron spots, especially with bleaching bath. Otherwise blue spots may form on prints.

Prints should be washed thoroughly and then bleached in solution 1 until the black image is converted to a very light brown color (about 1 minute). Prints should then be washed for 10 to 15 minutes and redeveloped in diluted solution 2.

Redevelopment should be complete in about 1 minute. After redevelopment the prints should be washed for about 30 minutes and then dried. If the toner should leave sediment which results in streaks or finger marks on the surface of the paper, the print should be immersed for a few seconds in a 3 % solution of acetic acid, after which a 10-minute washing is necessary.

Sulfide Toner for Warm Sepia Tones on Lantern Slides (Kodak T-10)

Solution A

Potassium ferricyanide	1 oz.	30 g.
Potassium bromide	$\frac{1}{2}$ oz.	15 g.
Water to make	32 oz.	1000 c.c.

Solution B

Sodium sulfide (not sulfite)	13 gr.	.9 g.
Water to make	32 oz.	1000 c.c.

Use three times the quantity if crystalline sodium sulfide is used.

The well washed slide, or film, is thoroughly bleached in solution A, washed for 5 minutes, and immersed in solution B for about 2 minutes until thoroughly toned. The slide should then be washed thoroughly for 10 to 15 minutes before drying. The transparency of the tone is much improved by the addition of a little hypo to the B solution, say, 66 gr. per 32 oz. or 4.5 g per 1000 c.c.

Uranium Toning Bath for Papers (Kodak T-17)

Stock Solution

Uranium nitrate	116 gr.	8 g.
Oxalic acid, crystals	58 gr.	4 g.
Potassium ferricyanide	58 gr.	4 g.
Water to make	32 oz.	1000 c.c.

Dissolve the uranium nitrate in a small volume of water, about 8 oz. (250 c.c.) (about 125° F.) (50° C.). Dissolve the oxalic acid separately in about 8 oz. (250 c.c.) of water and filter; then add the oxalic acid solution to the uranium nitrate solution. Dissolve the potassium ferricyanide separately in about 8 oz. (250 c.c.) of water; if the solution is clear, add it to the uranium nitrate and oxalic acid solution. If not clear, filter before mixing together.

For Use as a Toning Bath (Chocolate to Brick Red). Dilute 1 part of the stock solution with 2 parts of water. As the toning time is increased, the tone changes from chocolate to brown and finally to brick red. The print may be removed at any stage.

Wash until the highlights are clean; this usually requires from 10 to 15 minutes. Prolonged washing should be avoided.

PHOTOGRAPHIC FORMULAE (Continued)

Uranium Toner for Brown to Red Tones on Slides or Films (Kodak T-9)

Uranium nitrate.....	35	gr.	2.5	g
Potassium oxalate.....	35	gr.	2.5	g
Potassium ferricyanide...	15	gr.	1	g
Ammonium alum.....	85	gr.	6	g
Hydrochloric acid, 10 % solution.....	1½	dr.	5	c.c.
Water to make.....	32	oz.	1000	c.c.

To make a 10 % solution, add 1 part of hydrochloric acid to 9 parts of water, slowly with stirring.

Dissolve chemicals in the order given.

The solution should be perfectly clear and pale yellow in color. *It is light sensitive, however, and should be stored in the dark.*

The maximum toning effect is produced in about 10 minutes, the tone passing from brown to red during this time.

After toning, wash for about 10 minutes; the washing should not be prolonged, especially if the water is slightly alkaline, since the toned image is soluble in alkali.

Gold Toner (Agfa 231)

This formula gives a range of red tones to sepia-toned prints, the brilliance of the tone depending on the paper used. Brilliant chalk-red tones are produced on Cykon, while with Indiatone and Cykora darker shades are formed. If desired, deep blue tones may also be obtained with this formula by using black-and-white prints instead of prints that have first been sepia-toned. Unusual effects of mixed tones of blue-black shadows and soft reddish highlights can be produced by using prints which have been partially toned in a hypo alum sepia-toner.

Hot water (125° F. or 52° C.)...	24	oz.	750	c.c.
*Ammonium sulfocyanate.....	3½	oz.	105	g
Gold chloride, 1 % solution.....	2	oz. fl.	60	c.c.
Water to make.....	32	oz.	1000	c.c.

*May be substituted by:

Sodium sulfocyanate.....	3½	oz.	110	g
or				
Potassium sulfocyanate.....	4½	oz.	135	g

For Red Tones: Prints must first be bleached and toned by sulfide redevelopment method. After washing, place prints in above solution until toning is complete (requires 15-45 minutes). For redder tones one-half the specified amount of sulfocyanate may be used.

For Deep Blue Tones: Omit sepia toning operation and place well-washed black-and-white prints directly in above toning solution.

For Mixed Tones: Prints should be incompletely toned in a hypo alum toner and washed before treatment in above solution.

Iron Toner for Blue Tones on Papers (Kodak T-12)

Ferric ammonium citrate (green scales).....	58	gr.	4	g
Oxalic acid, crystals.....	58	gr.	4	g
Potassium ferricyanide.....	58	gr.	4	g
Water to make.....	32	oz.	1000	c.c.

PHOTOGRAPHIC FORMULAE (Continued)

Dissolve each chemical separately in a small volume of water, about 8 oz. (250 c.c.) and filter before mixing together. This solution does not keep well except in brown bottles.

Immerse the well-washed print in the toning bath for 10 to 15 minutes until the desired tone is obtained. Then wash until the highlights are clear.

Iron Blue Toner (Agfa 241)

Producing brilliant blue tones, this formula is suitable for use with Cykora, Brovira and Indiatone papers.

Hot water (125° F. or 52° C.).....	16 oz.	500 c.c.
Ferric ammonium citrate..	$\frac{1}{2}$ oz.	8 g
Potassium ferricyanide	$\frac{1}{4}$ oz.	8 g
Acetic acid, 28 %...	9 oz.	265 c.c.
Water to make.....	32 oz.	1000 c.c.

Solution should be prepared with distilled water if possible. If enameled iron trays are used, no chips or cracks in the enamel should be present or spots and streaks may appear in the print.

Prints for blue toning should be fixed in plain, non-hardening hypo bath (which should be kept at a temperature of 68° or under to avoid undue swelling). When prints have been fully toned in the above solution, they will be greenish in appearance, but will be easily washed out to a clear blue color when placed in running water.

The depth of the blue toning will vary somewhat with the quality of prints toned in it, light-toned prints generally toning to lighter blues. Some intensification of the print usually occurs in toning; consequently, prints should be slightly lighter than the density desired in the final toned print.

Wash water should be acidified slightly with acetic acid since the blue tone is quite soluble in alkaline solutions and is considerably weakened when wash water is alkaline. Pleasing variations in the tone can be obtained by bathing the washed prints in a $\frac{1}{2}$ % solution (5 g per 1000 c.c.) of borax which produces softer, blue-gray tones, the extent depending on the length of treatment.

Iron Toner for Blue Tones on Slides or Films (Kodak T-11)

Ammonium persulfate	7 gr.	.5 g
Iron and ammonium sulfate (ferric alum)	20 gr.	1.4 g
Oxalic acid...	45 gr.	3 g
Potassium ferricyanide...	15 gr.	1 g
Ammonium alum	73 gr.	5 g
Hydrochloric acid, 10 % solution	$\frac{1}{2}$ dr.	1 c.c.
Water to make.....	32 oz.	1000 c.c.

To make a 10 % solution, add 1 part of hydrochloric acid to 9 parts of water, slowly with stirring.

Dissolve chemicals in the order given.

The method of compounding this bath is important. Each of the solid chemicals should be dissolved separately in a small volume of water; the solutions then should be mixed strictly in the order given, and the whole diluted to the required volume. If these instructions are followed, the bath will be pale yellow in color and perfectly clear.

Immerse the slides or films from 2 to 10 minutes at 68° F. (20° C.) until the desired tone is obtained. Wash for 10 to 15 minutes until

PHOTOGRAPHIC FORMULAE (Continued)

the highlights are clear. A slight permanent yellow coloration of the clear gelatin will usually occur, but should be too slight to be detectable on projection. If the highlights are stained blue, then either the slide (film) was fogged during development, or the toning bath was stable or not mixed correctly.

Since the toned image is soluble in alkali, washing should not be carried out for too long a period, especially if the water is slightly alkaline.

BLUE PRINT PAPER, FORMULAE FOR SENSITIZING

1

Solution A

Water.	8.5 oz.	50 c.c.
Iron and ammonium citrate.	1.7 oz.	10 g

Solution B

Water.	8.5 oz.	50 c.c.
Potassium ferricyanide.	1.4 oz.	8 g

Filter separately. The solutions, which may be preserved separately for some time, are best kept in the dark. For use, mix, in a dark room or by an artificial light of low intensity, equal quantities of the two solutions.

Any non-absorbent paper may be sensitized by brushing the solution over it rapidly with a soft, wide, flat brush, going over the surface twice, the second coat being applied in a direction at right angles to the first. An alternative method is to lower the paper, beginning at one edge, on to the surface of the solution in a tray and allow it to float for a few seconds. Care must be taken to exclude air bubbles. After sensitizing by either method, the paper should be hung by one edge in a dark room to dry.

2

Blue printing depends to a large extent upon surface of paper. The following formula is recommended as producing clear whites:

Solution 1

Potassium ferricyanide, $K_3Fe(CN)_6$	10 g
Distilled water.	100 c.c.

Solution 2

Iron and ammonium citrate (ferric).	30 g
Water.	100 c.c.
Gum arabic (gum acacia).	5 g

Equal parts of the above solutions are mixed just before use. The paper to be sensitized may be floated on the surface or the liquid may be applied with a tuft of absorbent cotton using cross strokes to insure an even coating. The sensitized paper must be dried in the dark and should be used within 36 hours.

ULTRAVIOLET SENSITIZATION

Photographic plates can be made sensitive to short-wave ultraviolet light by immersion in a dilute solution of citric acid in 95 % ethyl alcohol (1 % citric acid). (Sodium salicylate may be substituted for the citric acid.) The plate is immersed in the citric acid solution and immediately withdrawn and dried in less than one minute by waving in the air before putting in the holder. After

PHOTOGRAPHIC FORMULAE (Continued)

exposure the plate can be developed without previous washing and without special precautions. The coating of citric acid adheres to the plate so that a number of plates may be treated and stored away for future use. Citric acid has no detrimental action on the emulsion or the developer. The sharpness of the image is not diminished.

FACTORIAL DEVELOPMENT

If the image first appears after immersion in the developer for a certain time, then this period of time multiplied by the "factor" for the particular developer used will give the total time required for full, normal development. The factor for the degree of development desired may well be determined by experiment; the following are suggested:

Amidol, 2 gr. per oz.	18
Glycin.	8-12
Hydroquinone.	4½-5
Metol.	30
Metol-hydroquinone.	14
Ortol.	10

Pyro, without bromide:

1 gr. per oz.	18
2 gr. per oz.	12
3 gr. per oz.	10
4 gr. per oz.	8
5 gr. per oz.	6

With 1 part bromide to 4 parts pyro:

1 gr. pyro per oz.	9
2 gr. pyro per oz.	5
3 gr. pyro per oz.	4½
4 gr. pyro per oz.	4

PLATE AND FILM SPEEDS

Compiled with the collaboration of
Chas. H. Shipman

It is pertinent to state that there is at present no exact way to indicate plate and film speeds. Also since different manufacturers do not use identical methods in their speed determinations the stated speeds vary among the different makes.

In 1900 two English amateurs, Messrs. Hurter and Driffield, proposed a system of plate speeds based on the assumption that, if a plate is given a series of graded exposures, and developed in a pyro developer free from bromide, a density-log exposure curve may be plotted from which a speed value may be determined which is supposed to be inversely proportional to the exposure required to produce average density. The Scheiner system is based upon the assumption that speeds are inversely proportional to the exposure necessary to produce a just visible image. It will be evident that these two systems cannot be compared exactly. Nor is either system correct since the assumptions upon which they are based are not exactly true. Nevertheless the results obtained by these methods are well within the latitude of the emulsions and will serve well as a starting point for all ordinary work. The exposures may be easily altered after a trial to produce the type of result desired.

Kodak Film Speeds are determined by a system of testing in which the exposure on which the speed number is based is taken as the value of exposure for which the slope at the lower part of the characteristic curve is three-tenths the average slope over an exposure range of 30:1 which is found to be the maximum contrast for the average scene.

There can be no simple relationship between speeds obtained in fundamentally different ways and the conversion table given below can be considered only a rough guide.

Comparison of Speed Systems

H & D American	Din	American Scheiner	Weston Numbers	Kodak Speeds	Relative Exposure
35	1/10	8	0.75	4	32

PLATE AND FILM SPEEDS

The following table presents the most recent figures available at the time of compilation for speed numbers in American Scheiner values and as given for two widely used exposure meters. Values are given for daylight and for tungsten or photoflood illumination.

Speed values given can be considered only as a general guide. Values given by different authorities differ somewhat according to the characteristics of the negatives considered satisfactory. In general the speeds given are for full exposure. The Weston and G. E. figures may be increased by about 50 per cent or the Scheiner values by about two units if a thinner negative is desired.

Many types of material no longer available are included in the table for purposes of comparison.

CROSS-SECTION AND MASS OF WIRES

U. S. Measure

Diameters are given in mils (1 mil = .001 in.), and area in square mils (1 sq. mil = .000001 sq. in.). For sections and masses for one-tenth the diameters given, divide by 100 and for sections and masses for ten times the diameter multiply by 100.

CROSS-SECTION AND MASS OF WIRES (Continued)

Metric Measure

Diameters are given in thousandths of a centimeter and area of section in square thousandths of a centimeter. $1 \text{ (cm/1000)}^2 = .000001 \text{ sq. cm}$
For sections and masses for diameters 1/10 or 10 times those of the table, divide or multiply by 100.

Diam. in thousandths of a cm	Cross-section in square thousandths of a cm	Grams per meter

RESISTANCE OF WIRES

The following table gives the approximate resistance of various metallic conductors. The values have been computed from the resistivities at 20°C, except as otherwise stated, and for the dimensions of wire indicated. Owing to differences in purity in the case of elements and of composition in alloys, the values can be considered only as approximations.

The following dimensions have been adopted in the computations.

B. & S. gauge	Diameter		B. & S. gauge	Diameter	
	mm	mils 1 mil = .001 in.		mm	mils 1 mil = .001 in.
10	2.588	101.9	26	0.4049	15.94

ACCELERATION DUE TO GRAVITY AND LENGTH OF THE SECONDS PENDULUM

FOR SEA LEVEL AT VARIOUS LATITUDES

Based on the formula of the U. S. Coast and Geodetic Survey. The length of the simple pendulum whose period is two seconds, that is which beats seconds, is computed in each case from the corresponding value of the acceleration.

Latitude °	Acceleration due to gravity		Length of seconds pendulum	
	cm/sec ²	ft./sec. ²	cm	in.

DATA IN REGARD TO THE EARTH

Equatorial radius, 6,378,388 meters, 3,963.34 miles.

Polar radius, 6,356,911.946 meters, 3,949.99 miles.

Radius of sphere having same volume, 6,371,221.3 meters, 3,958.89 miles.

Quadrant of the equator, 10,019,148.4 meters, 6,225.60 miles.

Quadrant of the meridian, 10,002,288.3 meters, 6,215.12 miles.

1° latitude at the equator = 68.70 miles.

1° latitude at the pole = 69.41 miles.

Mean density of the earth, 5 522 g/cm³, 344.7 lb./ft.³

Mass of the earth, 5.983×10^{21} kg, 6.595×10^{21} tons.

Mean surface density of the continents, 2 67 g/cm³, 166 7 lb./ft.³

Mean linear velocity of the earth in its orbit, 29.77 km/sec., 18.50 mi./sec.

Mean linear velocity of rotation of the surface at the equator, 0 465 km/sec., 0.289 mi./sec.

Land area, 148.847×10^6 km², 57.470×10^6 sq. mi.

Ocean area, 361.254×10^6 km², 139.480×10^6 sq. mi.

Highest mountain, Everest, 8840 meters, 29,003 ft.

Greatest sea depth, 10,430 meters, 34,219 ft.

Thermal gradient of the earth, higher at increasing depths, 30° C per km, 48° C per mi. (uncertain).

Mean distance to the sun, 149,500,000 km or 92,900,000 mi.

Mean distance to the moon, 384,393 km or 238,854 mi.

Chemical Composition of the Earth, Including the Atmosphere

Arranged in order of abundance

Element	%	Element	%
O	46.43	P	0.130

ATMOSPHERIC AND METEOROLOGICAL DATA

Total mass of the atmosphere, estimated by Ekholm, 5.2×10^{21} g., 11.4×10^{18} pounds, 5.70×10^{16} tons.

Evidence of extent: twilight, 63 km, 39 mi.; meteors, 200 km, 124 mi.; aurora 44-360 km, 27-224 mi.

Height if homogeneous at normal atmospheric pressure, 7991 m. 4.965 mi.
Composition of the atmosphere, mean percentage by volume, at sea level, of the dry air components.

N ₂	78.03	H ₂	0.01
O ₂	20.99	Ne	0.0012
A	0.94	He	0.0004
CO ₂	0.03		

* Distance to Earth.

Variation of Composition of the Atmosphere with Elevation. Percentage Distribution by Volume.

Atmospheric Electricity

Normal potential gradient:

Over land, 67 to 317 volts/m.

Over sea, 128 volts/m.

Potential gradient at Earth's surface beneath thunder cloud, 1×10^4 volts/m

Quantity discharged by lightning flash, 10-50 coulombs.

Energy of flash, 1×10^{17} ergs.

Potential difference between discharge points, 1×10^8 volts.

Angular Radius of Halos and Rainbows

Coronae due to small water drops

1° to 10°

Small halo, due to 60° angles of ice crystals

22°

Large halo, due to 90° angles of ice crystals

46°

Rainbow, primary

41° 20'

Rainbow, secondary.

52° 15'

Solar Constant

The energy falling on one sq. cm area at normal incidence equals 1.92 small calories per minute.

MOLECULAR CONSTANTS

The following gives the arithmetical average velocity, the mean free path, molecular diameter and collision frequency for the temperatures indicated and at standard pressure, 760 mm Hg. except as otherwise stated.

Gas	Average velocity in cm./sec.		Mean free path in cm at 75 cm Hg.		
	0° C	20° C	Boltzmann		Meyer
			0° C	20° C	20° C
Air	447×10^2	463×10^2			
Ammonia. . .	583	604	5.92×10^{-6}	6.60×10^{-6}	5.83×10^{-6}
Argon	381	395	8.98	9.88	8.73
Carbon monoxide	454	471	8.46	9.23	8.16

PHYSICAL CONSTANTS

NEW TABLE OF VALUES OF THE GENERAL PHYSICAL CONSTANTS

RAYMOND T. BIRGE, Reviews of Modern Physics 13, 233, 1941

Table A. Principal Constants and Ratios*

Section		
A	Velocity of light.....	$c = (2.99776 \pm 0.00004) \times 10^{10} \text{ cm} \cdot \text{sec}^{-1}$
B	Gravitation constant.....	$G = (6.670 \pm 0.003) \times 10^{-8} \text{ dyne} \cdot \text{cm}^2 \cdot \text{g}^{-2}$
C	Liter (= 1000 ml)	$l = 1000.028 \pm 0.002 \text{ cm}^3$
D	Volume of ideal gas (0°C, 1 atm.)	$V_0 = (22.4146 \pm 0.0006) \times 10^3 \text{ cm}^3 \cdot \text{atmos} \cdot \text{mole}^{-1}$
		$V'_0 = 22.4140 \pm 0.0006 \text{ liter} \cdot \text{atmos} \cdot \text{mole}^{-1}$
D	Volume of ideal gas (0°C, 1 atm.)	$V_{15} = (22.4157 \pm 0.0006) \times 10^3 \text{ cm}^3 \cdot \text{atmos} \cdot \text{mole}^{-1}$
		$V'_{15} = 22.4151 \pm 0.0006 \text{ liter} \cdot \text{atmos} \cdot \text{mole}^{-1}$
		$\rho = 1.00048 \pm 0.00002$
		$\eta = 0.99986 \pm 0.00002$
E	International ohm (= $\rho_{\text{abs-ohm}}$)	
E	International ampere (= $q_{\text{abs-amp}}$)	
F	Atomic weights (see Table A')	
G	Standard atmosphere.	$A_0 = (1.013246 \pm 0.000004) \times 10^6 \text{ dyne} \cdot \text{cm}^{-2} \cdot \text{atmos}^{-1}$
G	45° atmosphere.....	$A_{45} = (1.013195 \pm 0.000004) \times 10^6 \text{ dyne} \cdot \text{cm}^{-2} \cdot \text{atmos}^{-1}$
H	Ice-point (absolute scale)	$T_0 = 273.16 \pm 0.01^\circ \text{K}$
H	Joule equivalent.....	$J_0 = 1.1855 \pm 0.0004 \text{ abs-joule} \cdot \text{cal}_{15}^{-1}$
I	Joule equivalent (electrical)	$J_{15} = 1.1847 \pm 0.0003 \text{ int-joule} \cdot \text{cal}_{15}^{-1}$
I	Faraday constant	
J		
	(1) Chemical scale	
	$F = 96501.2 \pm 10 \text{ int-coul} \cdot \text{g-equiv}^{-1}$	
	$= 96487.7 \pm 10 \text{ abs-coul} \cdot \text{g-equiv}^{-1}$	
	$= 9648.77 \pm 1.0 \text{ abs. e.m.u.} \cdot \text{g-equiv}^{-1}$	
	$F' = F_e = (2.89247 \pm 0.00030) \times 10^{14} \text{ abs. e.s.u.} \cdot \text{g-equiv}^{-1}$	
K	Avogadro number (chemical scale)	$N_0 = (6.02283 \pm 0.0011) \times 10^{23} \text{ mole}^{-1}$
K	Electronic charge.....	$e = F/N_0 = (1.60203 \pm 0.00034) \times 10^{-20} \text{ abs. e.m.u.}$
		$e' = ec = (4.80251 \pm 0.0010) \times 10^{-10} \text{ abs. e.s.u.}$
L	Specific electronic charge	$e/m = (1.7592 \pm 0.0005) \times 10^7 \text{ abs. e.m.u.} \cdot \text{g}^{-1}$
		$e'/m = ec/m = (5.2736 \pm 0.0015) \times 10^{17} \text{ abs. e.s.u.} \cdot \text{g}^{-1}$
M	Planck constant.....	h (see Table C).

* Unless otherwise specified, all quantities in these tables that involve the mole or the gram equivalent are on the chemical scale of atomic weights.

Table A'. Atomic Weights

(1) Physical scale ($O^{16} = 16.0000$)	
$H^1 = 1.00813 \pm 0.000017$	
$H = 1.008276 \pm 0.000017$ (from H^1/H^2 abundance = 6900 \pm 100)	$H^2 = 2.01473 \pm 0.000001$
$He^4 = 4.00389 \pm 0.00007$	
$C^{12} = 12.00386 \pm 0.00004$	
$C = 12.01465 \pm 0.00023$ (from C^{12}/C^{13} abundance = 92 \pm 2)	$C^{13} = 13.00761 \pm 0.000015$
$N^{14} = 14.00753 \pm 0.00005$	
$N = 14.01121 \pm 0.00009$, (from N^{14}/N^{15} abundance = 270 \pm 6)	$N^{15} = 15.0049 \pm 0.0002$
$O^{16} = 16.0000$	$O^{18} = 18.0049$
$O = 16.004357 \pm 0.000086$ (from abundance $O^{16}, O^{17}, O^{18} = (506 \pm 10):1:(0.204 \pm 0.008)$)	
(2) Chemical scale ($O = 16.0000$)	
Ratio physical to chemical scale	
$r = (16.004357 \pm 0.000086)/16 = 1.000272 \pm 0.000005$	
$H^1 = 1.007856 \pm 0.000018$ (from physical scale)	
$H^2 = 2.01418 \pm 0.000021$ (from physical scale)	
$H = 1.00800 \pm 0.000018$ (from physical scale)	
$He^4 = 4.00280 \pm 0.00007$ (from physical scale)	
$C = 12.01139 \pm 0.00024$ (from physical scale)	
$N = 14.00740 \pm 0.00012$ (from physical scale)	
$N = 14.0086 \pm 0.0007$ (direct observation)	
$Na = 22.994 \pm 0.003$	$Cl = 35.457 \pm 0.001$
$Ca = 40.080 \pm 0.005$	$Ag = 107.880 \pm 0.002$
	$I = 126.915 \pm 0.004$

NEW TABLE OF VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table B. Additional Quantities Evaluated or Used in Connection with Table A

Section	Ratio of e.s.u. to e.m.u. (direct)	ϵ' = (2.99712 ± 0.0001) × 10 ¹⁰ cm ^{1/2} · sec ^{-1/2} · int-ohm ^{1/2}
A	Ratio of e.s.u. to e.m.u. (indirect)	= (2.9978 ± 0.0010) × 10 ¹⁰ cm · sec ⁻¹
Å	Average density of earth	ϵ' = ϵ = (2.99776 ± 0.00004) × 10 ¹⁰ cm · sec ⁻¹
B	Maximum density of water	δ = 5.517 ± 0.004 g · cm ⁻³
C	Acceleration of gravity (standard)	δ m(H ₂ O) = 0.999972 ± 0.000002 g · cm ⁻³
D	Acceleration of gravity (45°)	ρ = 980.665 cm · sec ⁻²
D	Density of oxygen gas (0°C, A ₄)	ρ = 980.616 cm · sec ⁻²
D	Limiting density of oxygen gas (0°C, A ₄)	I_1 = 1.42897 ± 0.00003 g · liter ⁻¹
D	Factor converting oxygen (0°C, A ₄) to ideal gas	I_{lim} = 1.427609 ± 0.000037 g · liter ⁻¹
D	International coulomb (= q abs-coul)	1 - α = 1.0009535 ± 0.000004
E	International gauss (= q abs-gauss)	η = 0.99986 ± 0.00002
E	International henry (= p abs-henry)	p = 1.00048 ± 0.00002
E	International volt (= pq abs-volt)	μq = 1.00034 ± 0.00003
E	International joule (= pq ² abs-joule)	pq^2 = 1.00020 ± 0.00004
E	Specific gravity of Hg (0°C, A ₀) referred to air-free water at maximum density	ρ^0 = 13.59542 ± 0.00005
G	Density of Hg (0°C, A ₀)	D_0 = 13.595040 ± 0.000057 g · cm ⁻³
J	Electrochemical equivalents (chemical scale)	E_{Ag} = 1.11800 × 10 ⁻³ g · int-coul ⁻¹
J	silver (apparent)	E_{Ag} = (1.11807 ± 0.00012) × 10 ⁻³ g · abs-coul ⁻¹
J	iodine (apparent)	E_I = (1.315026 ± 0.000025) × 10 ⁻³ g · int-coul ⁻¹
K	Effective calcite grating space (18°C), Siegbahn system	E_I = (1.31535 ± 0.00014) × 10 ⁻³ g · abs-coul ⁻¹
K	True calcite grating space (20°C), Siegbahn system	d_{18}'' = 3.02904 × 10 ⁻⁸ cm
K	True calcite grating space (20°C), c.g.s. system	d_{18} = (3.029512 ± 0.00018) × 10 ⁻⁸ cm
K	Ratio of grating and Siegbahn scales of wave-lengths	d_{20} = (3.035674 ± 0.00018) × 10 ⁻⁸ cm
K	Density of calcite (20°C)	λ_g/λ_c = 1.002034 ± 0.000060
K	Structural constant of calcite (20°C)	ρ = 2.71029 ± 0.00003 g · cm ⁻³
K	Molecular weight of calcite (chemical scale)	ϕ = 1.09594 ± 0.00001
K	Rydberg constant for hydrogen (H ₁)	M = 100.0914 ± 0.005
L	Rydberg constant for deuterium (H ₂)	R_H = 109677.5812 ± 0.0075 cm ⁻¹ (I.A. scale)
L	Rydberg constant for helium	R_D = 109707.4193 ± 0.0075 cm ⁻¹ (I.A. scale)
L	Rydberg constant for infinite mass	R_{He} = 109722.263 ± 0.012 cm ⁻¹ (I.A. scale)
L		R_{∞} = 109737.303 ± 0.017 cm ⁻¹ (I.A. scale)
L		or ± 0.05 cm ⁻¹ (c.g.s. system)

NEW TABLE OF VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Table C. Partial List of Derived Quantities*

Planck constant	$h = \left\{ \frac{2\pi^2 c^3 F^3}{R_\infty N_0^3 (e/m)} \right\}^{1/3} = (6.624_2 \pm 0.002_4) \times 10^{-27} \text{ erg} \cdot \text{sec}$
	$h/e = \left\{ \frac{2\pi^2 c^3 F^2}{R_\infty N_0^2 (e/m)} \right\}^{1/2} = (4.1349_0 \pm 0.0007_1) \times 10^{-11} \text{ erg} \cdot \text{sec} \cdot \text{e.s.u.}^{-1}$
	$h/e' = h/ec = \left\{ \frac{2\pi^2 F^2}{R_\infty N_0^2 (e/m)} \right\}^{1/2} = (1.3793_3 \pm 0.0002_4) \times 10^{-17} \text{ erg} \cdot \text{sec} \cdot \text{e.s.u.}^{-1}$
Atomic weight of electron	$\frac{E}{e} = F/(e/m)$ (physical scale) = $(5.4862_4 \pm 0.0017) \times 10^{-4}$ (chemical scale) = $(5.4847_8 \pm 0.0017) \times 10^{-4}$
Band spectra constant connecting wave number and moment of inertia	$\left. \frac{F^3}{5.65\pi^4 R_\infty N_0^3 (e'/m)} \right\}^{1/3} = (27.98_{88} \pm 0.01_0) \times 10^{-10} \text{ g} \cdot \text{cm}$
Boltzmann constant	$k = R_0/N_0 = 1.38047_4 \pm 0.00026_1 \times 10^{-16} \text{ erg} \cdot \text{deg}^{-1}$
Charge in electrolysis of one gram of H ₂	$F/H = 9572.17_7 \pm 1.0 \text{ abs. e.m.u.} \cdot \text{g}^{-1}$
Charge in electrolysis of one gram of H ⁺	$e/M_H^+ = F/H^+ = 9573.7_{60} \pm 1.0 \text{ abs e.m.u.} \cdot \text{g}^{-1}$
Compton shift at 90°	$h/mc = \left\{ \frac{2\pi^2 F^2 (e/m)^2}{R_\infty N_0^2} \right\}^{1/2} = (0.024265_{14} \pm 0.000005_7) \times 10^{-9} \text{ cm}$
Energy in ergs of one abs-volt-electron	$E_0 = 10^9 e = 10^9 F/N_0 = (1.60203_3 \pm 0.0003_4) \times 10^{-12} \text{ erg}$
Energy in calories per mole for one abs-volt-electron per molecule	$\frac{F (\text{abs. coul. per gram equiv})}{F_{10} (\text{abs. joules per cal})} = 23052.4_6 \pm 3.4 \text{ cal}_{18} \cdot \text{mole}^{-1}$

NEW TABLE OF VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Fine structure constant	$\alpha = 2\pi(e^2)/hc = \left\{ \frac{4\pi R_\infty F(e/m)}{N_0} \right\}^{1/2} = (7.2976 \pm 0.0008) \times 10^{-3}$
	$1/\alpha = 137.030 \pm 0.016$
Gas constant per mole	$R_0 = V_0 A_0 / T_0 = (8.31436 \pm 0.00038) \times 10^7 \text{ erg} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$
	$R_0' = R_0 \cdot 10^{-3} / J_{15} = 1.98646 \pm 0.00021 \text{ cal}_{15} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$
	$R_0'' = V_0' / T_0 = (8.20544 \pm 0.00037) \times 10^{-2} \text{ liter} \cdot \text{atmos} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$
	$R_0''' = R_0 / A_0 = V_0' / T_0 = 82.0566 \pm 0.0037 \text{ cm}^3 \cdot \text{atmos} \cdot \text{deg}^{-1} \cdot \text{mole}^{-1}$
also	$R_0 T_0 = V_0' A_0 = (2.37115 \pm 0.00006) \times 10^{10} \text{ erg} \cdot \text{mole}^{-1}$
Loschmidt number (0°C , 1 atm)	$n_0 = N_0' / V_0 = (2.6870 \pm 0.0005) \times 10^{19} \text{ atoms} \cdot \text{cm}^{-3}$
Magnetic moment of one Bohr magneton	$\mu_1 = (h/4\pi)(e/m) = \frac{1}{4\pi} \left\{ \frac{2\pi^2 F^2(e/m)^2}{R_\infty N_0} \right\}^{1/2}$
	$= (0.92731 \pm 0.0003) \times 10^{-10} \text{ erg} \cdot \text{gauss}^{-1}$
Magnetic moment per mole for one Bohr magneton per molecule	$\mu_1 N_0 = \frac{1}{4\pi} \left\{ \frac{2\pi^2 e^2 F^2(e/m)^2}{R_\infty N_0^2} \right\}^{1/2} = 5585.24 \pm 1.0 \text{ erg} \cdot \text{gauss}^{-1} \cdot \text{mole}^{-1}$
Mass of α -particle	$M_\alpha = (H^+ - 2E)/N_0 = (6.6442 \pm 0.0012) \times 10^{-24} \text{ g}$
Mass of atom of unit atomic weight	$M_0 = 1, N_0 = (1.66035 \pm 0.00031) \times 10^{-24} \text{ g}$
Mass of electron	$m = e/(e/m) = (F/N_0)/(e/m) = (9.1086 \pm 0.0032) \times 10^{-28} \text{ g}$
Mass of H^1 atom	$M_{\text{H}^1} = H^1/N_0 = (1.67339 \pm 0.00031) \times 10^{-24} \text{ g}$
Mass of proton	$M_p = (H^1 - E)/N_0 = (1.67248 \pm 0.00031) \times 10^{-24} \text{ g}$
Radiation density constant	$a = 8\pi^5 k^4 / 15c^3 h^3 = \left(\frac{V_0 A_0}{T_0} \right) \frac{4\pi^5 N_0 R_\infty (e/m)}{15c^3 F^2}$
	$= (7.5694 \pm 0.0049) \times 10^{-15} \text{ erg} \cdot \text{cm}^{-3} \cdot \text{deg}^{-4}$
Ratio mass H^1 atom to mass electron	$M_{\text{H}^1}/m = (e/m)(H^1/F) = 1837.561 \pm 0.56$
Ratio mass proton to mass electron	$M_p/m = (e/m) \left(\frac{H^1 - E}{F} \right) = 1836.561 \pm 0.56$
Second radiation constant	$c = hc/k = \frac{c^2 T_0}{V_0 A_0} \left\{ \frac{2\pi^5 F^2}{R_\infty N_0^2 (e/m)} \right\}^{1/2} = 1.4384 \pm 0.00034 \text{ cm} \cdot \text{deg}$

NEW TABLE OF VALUES OF THE GENERAL PHYSICAL CONSTANTS (Continued)

Specific charge of α -particle	$\dots 2e/M_\alpha = \frac{2F}{H\rho - 2\bar{E}} = 4822.33 \pm 0.51 \text{ abs. e.m.u. g}^{-1}$
Specific charge of proton	$\dots e/M_p = \frac{F}{H1 - \bar{E}} = 9378.77 \pm 1.0 \text{ abs. e.m.u. g}^{-1}$
Stefan-Boltzmann constant	$\sigma = ac/4 = \frac{2\pi^5 k^4}{15c^2 h^3} = \left(\frac{V_0 A_0}{T_0}\right)^4 \frac{\pi^2 N_0 R_\infty(e/m)}{15(F_0)^5}$ $= (5.672_{43} \pm 0.0037) \times 10^{-5} \text{ erg} \cdot \text{cm}^{-2} \cdot \text{deg}^{-4} \cdot \text{sec}^{-1}$
Wave-length associated with one abs-volt†	$\lambda_0 = 10^{-8} \left\{ \frac{2\pi^2 k^2}{R_\infty N_0^2 (e/m)} \right\}^{1/2} = (12395.4 \pm 2.1) \times 10^{-8} \text{ cm} \cdot \text{abs-volt}^{-1}$
Wave number associated with one abs-volt	$\nu_0 = 1, \lambda_0 = \frac{10^8 \left\{ R_\infty N_0^2 (e/m) \right\}^{1/2}}{c^2 \left\{ \frac{2\pi^2 k^2}{R_\infty N_0^2 (e/m)} \right\}^{1/2}} = 8067.4_0 \pm 1.4 \text{ cm}^{-1} \cdot \text{abs-volt}^{-1}$
Wien's displacement law constant‡	$A = c; 4.965114 \pm 0.28971_8 \pm 0.00007 \text{ cm} \cdot \text{deg}$
Zeeman displacement per gauss	$(e/m)/4\pi c = (4.66991 \pm 0.0013) \times 10^{-5} \text{ cm}^{-1} \cdot \text{gauss}^{-1}$

* In order to be able to calculate, by propagation of errors, the probable error in a derived quantity, it is necessary to express the quantity explicitly in terms of the various fundamental quantities of Table A, or of Table B, and that has been done in each case. Since in this paper e and h are treated as derived quantities, they do not therefore appear in such explicit expressions. But in calculating *numerical* values of derived quantities, the work can often be greatly simplified by using the values of other previously calculated derived quantities—in particular e and h . In order to show how certain derived quantities depend on quantities like e and h , such alternative expressions are given in many cases.

† The factor 10^{-8} was accidentally omitted, in G.C. 1929, in the equation for λ_0 .

‡ The factor 4.965114 is the root of $e^{\beta} + (\beta/\alpha) - 1 = 0$

ABBREVIATIONS AND SYMBOLS

Abbreviations

The following list of abbreviations is intended to cover those in common use in chemistry and physics. Symbols are presented in a separate list following the abbreviations.

A.	Acre	ca.	Circa, about; approximately	covers	Coversed sine
Å	Ångström unit	cal.	Calorie (gram)	c.p.	Candle power; circular pitch; center of pressure
a.	Are	cc. or c.c.	Cubic centimeter	cry. or cryst.	Crystalline; crystals
a.	Acid	cd.	Cord	csc	Cosecant
abs.	Absolute	c. cm	Cubic centimeter	csc ¹	Arc or angle whose cosecant is
abt.	About	Cent.	Centigrade	csh	Hyperbolic cosecant
a.c.	Alternating current	centi-	Prefix meaning 1/100	csh ¹	Inverse hyperbolic cosecant
acet.	Acetone	cf.	Confer, compare	CTU	Centigrade thermal unit
acet. a.	Acetic acid	c.f.m.	Cubic foot per minute	cu.	Cubic
al.	Alcohol	cgs	Centimeter-gram-second system of units	cu. cm	Cubic centimeter
alk.	Alkali	cgs	Cgs electrostatic system	cu. ft.	Cubic foot
alt.	Altitude	cgs	Cgs electromagnetic system	cu. in.	Cubic inch
amal.	Amalgam; amalgamated	ch.	Chain	cu. m	Cubic meter
amor. or amorph.	Amorphous	chl	Chloroform	cu. yd.	Cubic yard
amp.	Ampere	chl	Circular	cu. yd.	Cubic yard
anh.	Anhydrous	circ.	Circumference	ewt.	Hundredweight
antilog	Antilogarithm	circum.	Circumference	cyl.	Cylinder
ap.	Apothecaries'	cl	Centimeter	d	Derivative; decimal
appr.	Approximately	cm	Square centimeter	d.	Decomposes; day
aq.	Aqua; aqueous; water	cm ²	Cubic centimeter	d.	Dextrorotatory
aq. reg.	Aqua regia	cm ³	Cubic centimeter	d.c.	Direct current
asym.	Asymmetrical	c.m.	Circular mil	dec.	Decomposes
atm. or atmos.	Atmosphere (atmospheric)	coef.	Coefficient	dec ¹	Prefix meaning 1/10
At. No.	Atomic number	colog	Cologarithm	def.	Definition (s)
At. Wt.	Atomic weight	colorl.	Colorless	deg	Thermometric degree; absolute C unless contrary is indicated
aux.	Auxiliary	comm'l	Commercial	deka-	Prefix meaning 10
Av.	Average	conc.	Concentrated	deliq.	Deliquescent
av. or avoird.	Avoirdupois	cond.	Condensing	den. or dens.	Density
bar	Barometer	const.	Constant	dg	Decigram
bbl.	Barrel	cos	Cosine	diam.	Diameter
bd	Board	cos ⁻¹	Arc or angle whose cosine is; anticose of; inverse cosine of	dil.	Dilute
Bé	Beaumé (degrees)	cosec	Cosecant	dissd	Dissolved
B.G.	Birmingham gauge (hoop and sheet)	cosh	Hyperbolic cosine	dk	Deka-
b.h.p.	Brake horse power	cosh ¹	Inverse hyperbolic cosine	dk.	Dark
bl.	Blue	cot	Cotangent	dkg.	Dekagram
blk.	Black	cot ¹	Arc or angle whose cotangent is . . .	dcl	Dekaliter
B.M.	Board measure	coth	Hyperbolic cotangent	dcm	Dekameter
b.p.	Boiling point	coth ⁻¹	Inverse hyperbolic cotangent	dcm ²	Square dekameter
br.	Brown			dcm ³	Cubic dekameter
BTU	British thermal unit			dks	Dekastere
bu.	Bushel			dl	Deciliter
B.W.G.	Birmingham wire gauge				
bz.	Benzene				
C	Centigrade				
c.	Carat; centi-				
c.	Cold				
ca	Candle

din	Decimeter	ipsm	Foot-pound-second electromagnetic system	kg	Kilogram
dm ²	Square decimeter			kg-cal.	Kilogram-calorie
dm ³	Cubic decimeter			kg-m	Kilogram-meter
d.p.	Diametral pitch; double pole	F.S.	Factor of safety	kilo-	Prefix meaning 1,000
dr.	Dram	ft.	Foot	kl	Kiloliter
dr. ap. or 3 ap.	Dram, apothecaries'	ft. ²	Square foot	km	Kilometer
dr. av. or 3 av.	Dram, avoirdupois	ft.-lb.	Foot-pound	km ²	Square kilometer
dr. fl. or 3 fl.	Dram, fluid	fur.	Furlong	km ³	Cubic kilometer
dr. t. or 3 t.	Dram, troy	G	Gravitation constant	kva.	Kilovolt-ampere
ds	Decistere	g	Gram	kw.	Kilowatt
dwt.	Pennyweight	g-cal. or g-cal.	Gram calorie	kw.-hr.	Kilowatt-hour
efflor.	Efflorescent	gal.	Gallon	l	Liter
e.g.	<i>Exempli gratia</i> , for example	gel.	Gelatinous	l.	Long
h.p.	Effective horsepower	gi.	Gill	l	Laevorotary
E.L.	Elastic limit	glac.	Glacial	lat.	Latitude
cu	Cgs unit of quantity of electricity	glit.	Glittering	lb.	Pound
emf or e.m.f.	Electromotive force	glyc.	Glycerine	lb. ap.	Pound, apothecaries'
es	Electrostatic or cgs unit of quantity of electricity	gm.	Gram	lb. av.	Pound, avoirdupois
etc	<i>Et cetera</i> , and so forth	gr.	Gray; grain	lb. t.	Pound, troy
eth.	Ether	grn.	Green	leaf.	Leaflets
eth. acct.	Ethyl acetate	gyr.	Gyraton	lgr.	Ligroin
et. seq.	<i>Et sequentes</i> , and the following	h	Hecto-	h.	Link
evap.	Evaporation	h.	Hot; hour	lin.	Linear
ex.	Excess	ha	Hectares	liq.	Liquid
exp	Exponential function	hecto-	Prefix meaning 100	lim.	Limit
exp.	Explodes	hex.	Hexagonal	ln	Natural hyperbolic or Napierian logarithm
exsec	Exterior secant	hg	Hectogram	log or log.	Logarithm
F	Fahrenheit	hhd.	Hogshead	log _e	Logarithm to the base e, natural, hyperbolic or Napierian logarithm
f	From	hl	Hectoliter		Common logarithm, logarithm to the base 10
fahr.	Fahrenheit	hm	Hectometer		
fath.	Fathom	hm ²	Square hectometer	long.	Longitude
feath.	Feathery	hm ³	Cubic hectometer	lng.	Long
f.h.p.	Friction horsepower	hor. or horiz.	Horizontal	l.-p.	Low-pressure
fir.	Firkin	h.p.	High-Pressure	lt.	Light
fl.	Fluid	HP or h.p.	Horse power	lust.	Lustrous
fl. dr.	Dram, fluid	h.p.-hr.	Horse power-hour	m	Minim or drop
fl. oz.	Ounce, fluid	hr.	Hour	m	Meter; milli-
fluores.	Fluorescent	hyg.	Hygroscope	m ²	Square meter
ips	Foot-pound-second system of units	i.	Insoluble	m ³	Cubic meter
ipsm	Foot-pound-second electromagnetic system	ibid.	<i>Ibidem</i> , in the same place	m.	Minute
		i.e.	<i>Id est</i> , that is	m.	Meta-
		igu.	Ignites	max.	Maximum
		i.h.p.	Indicated horsepower	med.	Medium
		in.	Indigo, inch	meth.	Methyl
		in. ²	Square inch	meth. al.	Methyl alcohol
		in. ³	Cubic inch	m.e.p.	Mean effective pressure
		inc.	Inclusive	met.	Metallic
		in.-lb.	Inch-pound	mg	Milligram
		insol.	Insoluble		
		Int.	International

m l.h.	Mean lower hemispherical candle power	pyr.	Pyridine	sq. rd.	Square rod
c.p.	hemispherical candle power	Q	Quantity	sq. yd.	Square yard
mm	Millimeter	q	Quintal	std.	Standard
mm ²	Square milli- meter	qt.	Quart	subl.	Sublimes
mm ³	Cubic milli- meter	q.v.	Quod vide, which see	sym.	Symmetrical
mmf or m.m.f.	Magnetomotive force	R	Radium; radioactive mineral	t	Metric ton
mol.	Molecule	rac	Racemic	t.	Troy
Mol. Wt.	Molecular weight	rad	Radian, meas- ure of angle	tab. or tabl.	Tablets
monocl.	Monochrome	rad.	Radius	tan	Tangent
m.p.	Melting point	rd.	Rod	tan ⁻¹	Arc or angle whose tan- gent is . . .
m s c p	Mean spherical candle power	reg.	Regular	tanh	Hyperbolic tan- gent
myria-	Prefix meaning 10,000 or 10^4	rev.	Revolution	tanh ⁻¹	Inverse hyper- bolic tangent
mμ	Millimicron; millimicro-	rhbdr.	Rhomboidal	temp.	Temperature
N	Numeric; num- ber (in mathe- matical ta- bles)	rhomb.	Rhombic or or- thorhombic	tetr. or tetr.	Tetragonal
n	Normal	R.M.S.	Square root of mean square	tn.	Ton
n	Refractive index	r.p.m.	Revolutions per minute	tr.	Transition
need.	Needles	s	Stere	triel.	Trichine
o	Ortho-	s.	Seruple; soluble; second	trig.	Trigonal
Obs	Observer	s. ap. or s)	Seruple, apothec- aries'	trim.	Trimetric
octahdr.	Octahedral	sat. or sat'd	Saturated	T.S.	Tensile strength
oil	Oil of turpen- tine	se.	Scales	turp.	Turpentine
or.	Orange	S.E.	Siemens unit	Tw	Degrees Twad- dell, hydrom- eter scale
oz.	Ounce	sec or sec.	Second (mean solar unless contrary is stated)	ult.	Ultimate
oz. ap. or 3 ap.	Ounce apothec- aries'	sec	Secant	uns.	Unsymmetrical
oz. av. or 3 av.	Ounce avoyn- dupois	sec ⁻¹	Arc or angle whose secant is . . .	U.S.	United States of America; universal sys- tem of lens apertures
oz fl. or 3 fl.	Ounce, fluid	sech	Hyperbolic secant	v.	Very
oz. t. or 3 t.	Ounce, troy	sech ⁻¹	Inverse hyper- bolic secant	v.	Vide, see
p	Para-	segm.	Segment	vel. or veloc.	Velocity
pa.	Pale	sh.	Short	vers	Versed sine
p. et.	Per cent	sin	Sine	vert	Vertical
		sin ⁻¹	Arc or angle whose sine is . . .	vise.	Viscous
		sinh	Hyperbolic sine	vol.	Volume
		sinh ⁻¹	Inverse hyper- bolic sine	volt.	Volaltizes
		sl.	Slightly	w.	Water
		sm.	Small	wh.	White
				wt.	Weight
				yd.	Yard
				ycl.	Yellow
				yr.	Year
				μ	Micron; micro-
				μμ	Micromicron; micromicro-

ABBREVIATIONS AND SYMBOLS (Continued)

Symbols

The following list of symbols is rearranged from a report of the Committee on Letter Symbols and Abbreviations of the American Association of Physics Teachers, H. K. Hughes chairman, published in the American Journal of Physics 8, 300-315, 1940.

Symbols or definitions in parentheses are those whose use is discouraged by the committee. Symbols or meanings indicated by an asterisk (*) are not recommended by the committee but have been added to the list for the sake of completeness.

English Letter Symbols

A	Magnetic vector potential.
A_n	Normal atmosphere*.
A₄₅	Atmosphere, 45° latitude*.
A	Helmholtz function or maximum isothermal work function or Helmholtz free energy [$= U - TS$]; refracting angle of prism; area; amplitude; strength of simple acoustic source; atomic weight.
A, A_p	Power gain of amplifier; power amplification of amplifier.
A, A_v	Voltage gain of amplifier; voltage amplification of amplifier.
A, b	Richardson equation factors [$I_s = AT^2 \exp(-b/T)$].
a	Linear acceleration.
a	Width of slit, transparent portion; semimajor axis of ellipse; radius of tube, disk or membrane, acous.; coefficient of accommodation; mean absorption coefficient for a room, acous.; absorption coefficient [$I_x = I_0 \exp(-ax)$]; chemical activity; aperture, optics.
a₁	Bohr radius [$= h^2/4\pi^2 me^2$].
a (subscript)	Adsorbed.
a_i (subscript or bar over symbol)	Average value (e.g., \bar{I} , I_{ar}).
a, b	Van der Waals constants.
B	Magnetic flux density or induction; magnetic induction density.
B	Density of electric charge of magnetic flux [$d\Phi/dA$]; brightness or luminance [$= dI/dA \cos \theta$].
B, b	Susceptance or reciprocal of reactance.
(B)	Steradiancy or steradiancy [$= dW/d\omega$].
b	Seminor axis of ellipse; closest possible distance of approach (in Rutherford scattering formula); first Wien displacement constant [$= \lambda_m T$]; breadth or width.
b₁	Second Wien displacement constant [$= J_m/AT^5$].
(C)	Root-mean square velocity.
c	Molar thermal capacity; normality; (rms speed); capacitance or permittance; compliance.
C_p, C_v	Molecular heat at constant pressure, at constant volume*.
(c₀)	Most probable velocity.
c	Velocity of light in vacuum; specific heat or thermal capacity; coefficient of induction, or partial capacitance; distance from neutral axis to extreme fiber (beams); velocity of sound or other waves; acoustic conductivity of an opening; concentration of solutions.
c (with suitable subscripts)	Partial capacitance.
(c₀)	Most probable speed.
c_p	Specific heat or thermal capacity for constant pressure.
c_v	Specific heat or thermal capacity for constant volume.
c₁, c₂	Planck radiation law constants [$J_\lambda = Ac\lambda^{-5}/(\exp c_2/\lambda T - 1)$].
c (subscript)	Cathode; critical properties.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

D	Displacement; displacement flux density; electric flux density [= $\int \mathbf{D} \cdot d\mathbf{A}$]; electric induction density.
$\dot{\mathbf{D}}$, $\dot{\mathbf{D}}/4\pi$	Displacement current.
D	Derivative operator.
δ	Minimum deviation angle; coefficient of diffusion, fluid; diameter; optical density [= $\log_{10} I_0/I$]; power of lens system or refracting power [= n/f diopters]; relative density; density of electric flux [= $d\psi/dA$]; optical attenuation; angular dispersion [= $d\theta/d\lambda$]; (density [= m/V]).
d	Differential operator.
d	Distance between corresponding points of grating; distance between lens units in an optical system; interplanar distance (Bragg law); spacing of Bragg planes in a crystal.
$d_{t_1}^{t_2}$	Specific gravity at temperature t_2 , with reference to water at temperature t_1^* .
(E)	Electric potential gradient; electric field strength or intensity.
E	Illumination or illuminance [= dF/dA]; total energy, other than work; electromotive force or electromotance or emf; Young's modulus of elasticity; (internal or intrinsic energy, thermodyn).
E_k	Kinetic energy.
E_p	Potential energy.
E_v	Total energy of vibration.
\mathcal{E}	Irradiance or irradiance [= $d\phi/dA$ or dP/dA , w cm^{-2}].
(\mathcal{E})	Electric potential gradient; electric field strength or intensity.
e	Eccentricity of ellipse; probable error; base of natural logarithms [= 2.718 . . .]; modulus of electronic charge; coefficient of restitution or resilience.
F	Force.
Γ	Force in a string or membrane; luminous flux [= dQ/dt], hyperfine quantum number [= $I + J$]; Faraday constant or equivalent; formality; (weight); (Helmholtz function or maximum isothermal work function or Helmholtz free energy [= $(U - TS)$]).
F, F_g	Gravitational force.
\tilde{F}	Magnetomotive force or magnetic scalar potential.
f	Relative humidity; fugacity; frequency (electric circuits, mechanics, sound); focal length of object space; coefficient of friction, if μ designates the Poisson ratio; degrees of freedom, kinetic theory and Gibbs phase rule.
(f_0)	Photoelectric threshold frequency.
f_r	Natural or resonant frequency.
f'	Focal length of image space.
f, F	Function; distribution function.
f (subscript)	Filament.
G	Newtonian gravitational constant; Gibbs free energy, Gibbs function or free enthalpy [= $H - TS$].
g	Landé factor; statistical weight or degeneracy; gyromagnetic ratio; gravitational acceleration.
g_g	Grid or input conductance.
$g_{gp}, (g_m)$	Grid-plate transconductance, real part of grid-plate transadmittance.
g_L	Gravitational acceleration, local value.
g_p	Plate or output conductance.
g_s	Gravitational acceleration, standard value [= 980.665 cm sec^{-2}].
g_{45}	Gravitational acceleration 45° value [= 980.616 cm sec^{-2}].

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

G, g	Reciprocal resistance or conductance; electric conductance.
g (subscript)	Reference to gas or vapor.
H	Magnetic field strength or intensity.
H	Hamiltonian function or operator.
II	Irradiancy or irradiance [$= d\Phi/dA$ or dP/dA , $w\text{ cm}^{-2}$]; Hessian function; with suitable subscript, Hermitian function; heat content or enthalpy; Henry law constant; Boltzmann function $\left[= \sum_i n_i \ln n_i \right]$.
\mathcal{H}	Perturbing Hamiltonian function or operator.
h	Head, hydrodyn.; radius of lens zone; Planck constant; degree of hydrolysis, electrolytes; depth or height.
\hbar	Dirac $\hbar [= h/2\pi]$.
h, k, l	Miller indices.
$h_1 = nh, h_2 = nk, h_3 = nl$	Bragg reflection indices.
h (subscript)	Heater.
I	Rectangular areal moment of inertia [$= \int y^2 dA$]; integration constant of Gibbs function equation; luminous intensity or candlepower [$= dF/d\omega$, lu/steradian], nuclear spin; strength of magnetic shell; acoustic intensity, e.g., $\text{erg cm}^{-2} \text{ sec}^{-1}$; activity at time t , radioactivity; conduction current; steady direct current; rms or effective current; convection current.
I_0	Initial luminous intensity; initial activity, radioactivity
I_Q	Quiescent current.
I_s	Saturation current, total electron emission or saturation.
I_{xy} , etc.	Product of inertia.
I, I_{xz} , etc.	Moment of inertia.
I, I_a	Average current.
$\hat{I}, (I_{pk})$	Peak current.
$I_m, (I_{\max})$	Maximum current.
i	Unit vector in X-direction.
i	Mole factor or van't Hoff coefficient; inertia of photographic plate; vapor pressure constant.
$i, (I)$	Instantaneous current.
$J, (J')$	Electric Joule equivalent.
J	Jacobian determinant; mechanical equivalent of heat or Joule equivalent; polar areal moment of inertia [$= \int r^2 dA$]; number of equivalents; total inner quantum number; radiant intensity [$= d\Phi/d\omega = dP/d\omega$]; total emissive power; variable action; (moment of inertia).
J_λ	Spectral radiant intensity [$= dJ'/d\lambda$].
J_λ, J_ν	Monochromatic emissive power.
j	Unit vector in Y-direction.
j	Inner quantum number, inverse Jacobian determinant [$J = 1$].
K	Karat*; Kelvin, or absolute C scale of temperature*.
K_λ	Visibility factor or luminosity or monochromatic luminous efficiency [$= F_\lambda/P_\lambda = F_\lambda/\Phi_\lambda \text{ lu } w^{-1}$].
K	Extinction coefficient or index [$= (I/r) \log_{10} I_0/I$]; Kerr constant; luminous efficiency [$= F'/P = F'/\Phi$]; equilibrium constant, products/reactants; curvature.
K_h	Hydrolysis constant.
k	Unit vector in Z-direction.
k	Volume modulus of elasticity; molecular gas constant or Boltzmann constant; torque per unit twist or torsion constant; magnetic volume susceptibility [$\mathbf{M} = k\mathbf{H}$]; wave-length constant [$= 2\pi/\lambda$]; load per unit

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

	displacement; magnetic susceptibility; radius of gyration; restoring force per unit displacement; spring constant [= $-F/s$]; force constant [= $-F/s$]; specific reaction velocity, specific reaction rate or reaction velocity constant; velocity coefficient of chemical reaction*; thermal conductivity; coefficient or factor of compressibility; coupling coefficient.
k_g	Cind conductance at zero frequency and constant plate potential [= $(\partial i_g/\partial v_g)_{v_p}$].
k_p	Plate conductance at zero frequency and constant grid potential [= $(\partial i_p/\partial v_p)_{v_g}$].
L	Torque*.
L	Lagrange function or Lagrangian or kinetic potential [= $E_k - E_p$]; total azimuthal or orbital quantum number; relative heat content; total heat of fusion or vaporization; inductance; with suitable subscript, Laguerre function; Lorentz unit [= $Be/4\pi mc^2$]; (standard density, referred to $\gamma_r = 980,665 \text{ cm sec}^{-2}$ at 0°C , 1 A_m).
L_{12}	Mutual inductance.
\bar{L}	Heat of fusion or vaporization, per mole.
L, l	Length of heat flow path.
l	Free path; azimuthal or orbital quantum number; heat of fusion or vaporization per unit mass; length of vibrating string, rod or tube; length.
l_0	Length rest.
l_T	Tait free path.
\bar{l}	Heat of fusion or vaporization per molecule; mean free path.
l (subscript)	Reference to liquid.
M	Intensity of magnetization, magnetization or magnetic polarization.
M	Mutual inductance; total mass; mass per mole; total magnetic quantum number.
M, \bar{M}	Molecular weight.
M, \bar{M}	Ionic molecular weight, if necessary to distinguish between ions and neutrals.
$M[\alpha]$	Molecular rotatory power*.
$M[\omega]$	Molecular magnetic rotatory power*.
m	Moment of atom, dipole or molecule; magnetic moment, total.
m	Order of spectrum; number of phases, elec. circuits; magnetic quantum number; magnification; mass of molecule; modulation factor; mass of electron; mass*; (strength of magnetic pole).
m_e	Electronic mass, when m is magnetic quantum number.
m_H	Mass of a hydrogen atom*.
m_l	Longitudinal mass [= $m_0/(1 - \beta^2)^{1/2}$].
m_0	Rest mass.
m_t	Transverse mass [= $m_0/(1 - \beta^2)^{1/2}$].
m or \max (subscript)	Maximum.
\min (subscript)	Minimum.
N	Avogadro's number*.
N	Safety factor; number of turns or of conductors; number of molecules; total number of lines of a grating; number of atoms or nuclei at time t , radioactivity; normalization factor, probability.
N_0	Initial number of atoms or nuclei, radioactivity.
$N_{1,2,\dots}$	Number of atoms or nuclei, if more than one type is considered.
$N^0_{1,2,\dots}$	Initial number of atoms or nuclei, if more than one type is considered, radioactivity.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

N, N_0	Number of molecules per gram-molecule, 0°C , 1A, or Avogadro number.
n	Number; number of components, Gibbs phase rule; number of molecules per unit volume or molecular concentration; number of moles; number of revolutions or rotations per unit time; principal quantum number; rotational frequency [rev./time]; rigidity or shear modulus of elasticity; refractive index; (order of spectrum); molecular concentration or molecular density [= no./cm ³]; (angular frequency without damping).
n_d	Group refractive index.
n_0	Number of molecules per cubic centimeter 0°C , 1A, or Loschmidt number.
(n')	Angular frequency of free vibration with damping.
n_a, n_k	Transport number for anion, kation*.
(O)	Atomic weight of oxygen*.
(O)	Opacity, reciprocal of absorbance.
\mathbf{P}	Electric polarization.
\mathbf{P}_s	Surface polarization or strength of double layer, electric.
P	Probability; active power, elec.; power, used with same system of subscripts as for potential difference except that P unmodified signifies average power; radiant power or flux [= dU/dt]; amplitude of simple harmonic pressure, acous.
P_i	Input power.
$P_{l,m}$	Legendre polynomial.
P_0	Static pressure, acous.; output power.
P_p	Plate power.
\mathbf{p}	Generalized momentum; electric moment of atom, molecule or dipole; total electric moment.
p	Heaviside time operator [= d/dt].
p	Vapor pressure; partial potential coefficient; varying pressure, acous.; partial pressure; impact parameter, Rutherford scattering formula; number of pairs of magnetic poles, elec. mach.; distance between a principal plane of a lens system and the appropriate principal plane of a unit; generalized momentum; strength of magnetic pole; pressure; osmotic pressure; potential coefficient; (angular frequency of impressed force).
p_c	Critical pressure.
p (subscript)	Plate.
Q	Figure of merit of reactance [= X/R]; electric quadrupole moment; thermoelectric power; luminous energy [= $\int Fdt$]; quantity of heat; quantity of light or luminous energy; Q-factor, or quality factor, of reactor [= X/R]; moment of area [= $\int ydA$].
q	Generalized coordinate; heat entering system.
q, Q	Electric charge; quantity of electric charge.
R	Gas constant [= pV/nT]; thermal resistance; Rydberg constant; radiation resistance; range, radioactivity; rotational quantum number; acoustic resistance; (radius of tube, disk or membrane, acous.).
R_∞	Rydberg constant at infinite mass.
\mathcal{R}	Reluctance; radiance or radiant emittance or radiance
	or radiant flux density [= $d\Phi/dA = dP/dA, \text{w/area}$].
\mathbf{r}	Radius vector; position vector.
r	Residual of an observation; radial distance; nuclear radius; radius, relative humidity; specific acoustic resistance [= R/A]; spherical coordinates θ [= colatitude], λ [= latitude], φ [= longitude].
r_p	Plate resistance
$R, (r)$	Electric resistance.
r, θ	Polar coordinates.
$r, \theta, z, (y)$	Cylindrical coordinates.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

r (subscript)	Reduced properties.
S	Area; total spin; static sensitivity of photoelectric tube; reciprocal capacitance or elastance; total spin quantum number, strictly speaking, spin is not a quantum number; entropy; action; effective molecular cross section; area of cross section, walls, acous.
s	Linear displacement.
s	Length of arc or path; linear distance; spin quantum number, strictly speaking, spin is not a quantum number; dynamic sensitivity of photoelectric tube; slip; spin; displacement in general; distance between object and corresponding principal plane; object distance, optics; acoustic condensation.
s_p	Transconductance at zero frequency and constant plate potential [$= (\partial i_p / \partial v_p)_{v_p}$].
s'	Image distance; distance between image and corresponding principal plane.
S_{2870}, s_{2870}	2870 tungsten sensitivity of photoelectric tube.
s (subscript)	Reference to solid.
T	Torque*.
T	Kelvin temperature; reverberation time; half-life, radioactivity; period of a periodic motion; oscillation period; (kinetic energy; force in a string or membrane).
T_0	Absolute temperature of ice-point; absolute ice-point.
t	Time; length of prism base; transmission coefficient [$t = I_x / I_0 = \exp(-\alpha x)$]; ordinary temperature.
t_0	Ordinary ice-point.
t_c, T_c	Critical temperature.
t (subscript)	Transition between polymorphic forms.
t	Radiant energy; potential energy; total energy, other than work; internal or intrinsic energy, thermodyn.
u	Velocity; linear or particle velocity; with suitable subscript, ionic velocity; (component of linear or particle velocity).
u_0	Initial velocity.
$u_{x,y,z}$	Component of linear or particle velocity; rectangular component of velocity.
\hat{u}	Most probable velocity.
\bar{u}	Root-mean-square velocity.
u	Linear or particle speed; speed; density of radiant energy [$= dU/dV$]; reaction velocity [$= -dc/dt$]; time-independent wave function.
u_0	Initial speed.
\hat{u}	Most probable speed.
\bar{u}	Rms speed.
u, u_g	Group velocity.
u, u_t	Velocity at time t .
u, u_φ	Phase or wave velocity.
\bar{u}, u_{av}	Average velocity.
u, u_t	Speed at time t .
\bar{u}, u_{av}	Average speed.
V'	Volume; volume of a cavity or room; rms or effective potential difference; steady d.c. potential difference; molecular volume; shearing force in beam section; electric potential; specific magnetic rotation or Verdet constant; configuration-space volume; atomic volume; (time-dependent variable in Hamilton-Jacobi equation; electromotive force or electromotance or emf; potential energy).
V_c	Critical volume.
V_e	Excitation potential; excitation potential difference.
V_i	Ionization potential.
V_p	Volume of perfect gas, 0°C, A_n .
V_0	Quiescent potential difference.

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols(Continued)

V_s	Seebeck potential difference.
V_t	Thomson potential difference.
V_c	Contact or Volta potential difference.
V_π	Peltier potential difference.
V_m	Maximum peak potential difference.
v	Velocity; linear or particle velocity; (component of linear or particle velocity).
v_0	Initial velocity.
$v_{x,y,z}$	Component of linear or particle velocity; rectangular component of velocity.
\bar{v}	Most probable velocity.
v	Root-mean-square velocity.
v	Specific volume [l^3/m]; linear or particle speed; speed; velocity of sound or other waves; vibrational quantum number; instantaneous potential difference.
v_0	Initial speed.
v	Volume per gram mole of ideal gas at 0°C and 1 atm.
\bar{v}	Most probable speed.
v	Rms speed.
V_i, V_j	Inner potential, metals.
$V_m(V_{max})$	Maximum potential difference.
\bar{V}, V_m	Average potential difference.
$\hat{V}, (V_{pk})$	Peak potential difference.
v_g, v_d	Group velocity.
v, v_t	Velocity at time t .
\bar{v}, v_t	Average velocity.
v, v_t	Speed at time t .
v_c, v_r	Critical volume, reduced volume*.
\bar{v}, v_{av}	Average speed.
\mathcal{H}	Radiant emittance or radiant flux density or radiance or radiance [$= d\Phi/dA = dP/dA$, w/area]; time-dependent variable in Hamilton-Jacobi equation; (weight).
(w)	Phase or wave velocity; component of linear or particle velocity.
"	Weight; mixing ratio or water-vapor content; net work function.
w_g	Gross work function.
$\mathcal{H}, (w)$	Work
X	Volume displacement, acoust.; acoustic reactance.
X_C	Capacitive reactance.
X_L	Inductive reactance.
"	Distance between object and principal focus of object space; specific acoustic reactance [$= X/A$].
x'	Distance between image and principal focus of image space.
x, y, z	Rectangular coordinates; variable.
Y	Young's modulus of elasticity; admittance or reciprocal impedance.
$Y_{l,m}$	Associated Legendre polynomial or spherical function [$= P_{l,m}(\theta) \exp im\phi$].
"	Super-compressibility factor; length of object, optics; variable; (depth or height).
y_g	Grid or input admittance or reciprocal impedance with plate-load [$= y_g - j b_g$].
y_{op}	Grid-plate transadmittance [$= y_{op} - j b_{op}$].
y_p	Plate or output, admittance or reciprocal impedance [$= y_p - j b_p$].
y'	Length of image; image size.
Z	Gram-equivalent weight; radius of image of a point; modulus of section [$= l/c$, where c is distance of neutral axis from extreme fiber]; number of molecular collisions per unit time or collision frequency; coefficient of relative viscosity, referred to water; atomic

ABBREVIATIONS AND SYMBOLS (Continued)

English Letter Symbols (Continued)

- number; acoustic impedance; radius of circle of least confusion.
- z** Variable; electrochemical equivalent; valence; specific acoustic impedance [= Z/A].

Greek Letter Symbols

- α** Angular acceleration.
- α** Half-angle subtended by point object at objective of microscope; thermal coefficient of resistance; end correction for a tube, acous.; fine-structure or Sommerfeld constant [= $ch/2\pi r^2$]; specific rotatory power [= θ/lc]; degree of dissociation or ionization, electrolytes; linear expansivity or linear coefficient of expansion; absorption or absorption factor [= F_0/F_1]; absorption coefficient of absorbing material, acous.; angular resolving power of telescope; attenuation constant [$\gamma = \alpha + j\beta$]; temperature coefficient of resistance; coefficient of recombination; (plane angle).
- α'** Coefficient of thermal expansion or expansivity of a gas.
- α, α_l** Linear coefficient of thermal expansion or linear expansivity.
- $\alpha, \alpha', \alpha_V$** Volume expansivity or coefficient of expansion.
- β** Phase constant [$\gamma = \alpha + j\beta$]; u/c ; pressure coefficient; $1/\lambda T$; ratio of speed to speed of light [= v/c]; relativity ratio [= v/c]; specific heat constant*; (plane angle).
- Γ** Reciprocal inductance [= $1/L$].
- γ** Coefficient of surface tension; propagation constant [= $\alpha + j\beta$]; weightivity or specific weight [w/V]; ratio of specific heat or thermal capacity [= c_p/c_v]; adiabatic exponent [$pV^\gamma = \text{const.}$]; angular magnification [= $\tan u'/\tan u$]; contrast of photographic emulsion, electric conductivity [$\mathbf{I} = \gamma \mathbf{E}$].
- Δ** Optical length of microscope tube; quadratic discriminant [= $b^2 - 4ac$]; difference in optical path; distance between adjacent principal foci of two lens units; small finite change operator; cubic discriminant [= $(b^2 - 4) + (a^3/27)$].
- δ** Piezoelectric strain constant or modulus; deflection or total elongation; total thermal expansion; frequency deviation [= $\Delta f/f$]; galvanometer deflection; variation operator; angle of deviation; beam deflection or sag.
- δ_n** Minimum deviation angle.
- ϵ** Piezoelectric stress constant; molecular kinetic energy, average [= $\frac{1}{2}m\bar{v}^2$]; base of natural logarithms [= 2.718 . . .]; self-energy [= mc^2]; dielectric coefficient or permittivity or capacity; epoch angle.
- ϵ_h, ϵ_r** Electrode potential above that of normal hydrogen, of normal calomel, electrode*.
- ϵ, ϵ_r** Relative dielectric coefficient or specific inductive capacity.
- η** Coefficient of viscosity; efficiency; electric susceptibility [$P' = \eta E$].
- η_l** Current efficiency, electrolysis [= $I_{\text{useful}}/I_{\text{total}}$].
- η_V** Voltage efficiency [= $V_{\text{theor}}/V_{\text{actual}}$], electrolysis.
- $\eta(\xi, \eta, u)$** Transverse displacement, acous.
- θ** Angular displacement.
- θ** Angle of contact; polar coordinate angle; polar angle, colatitude; angle of optical rotation; angular distance; plane angle; angle of diffraction; glancing angle; (Kelvin temperature, ordinary temperature).
- κ** Electric conductivity [$\mathbf{I} = \kappa \mathbf{E}$]; volume modulus of elasticity; coefficient or factor of compressibility; susceptibility, magnetic*; absorption index [= $(\lambda/4\pi x) \ln I_0/I$].
- Λ** Nuclear dissociation energy; permeance [= L/N^2]; equivalent conductivity, mho/mole; spherical Laplace operator
- $$\left[\frac{1}{\sin \theta} \frac{\partial}{\partial \theta} \left(\sin \theta \frac{\partial}{\partial \theta} \right) + \frac{1}{\sin^2 \theta} \frac{\partial^2}{\partial \varphi^2} \right].$$
- λ** Linear density [= m/l]; mass per unit length; free path; wavelength; latitude, colatitude = ϕ ; disintegration constant [$N = N_0 \exp(-\lambda t)$]; linear charge, density; (linear expansivity or linear coefficient of expansion).

ABBREVIATIONS AND SYMBOLS (Continued)

Greek Letter Symbols (Continued)

λ_m	Wave-length of maximum monochromatic radiance of black-body at stated temperature*.
λ_T	Tait free path.
$\bar{\lambda}$	Mean free path.
μ	Partial molal, or chemical potential Gibbs function [= $\partial G/\partial n$]; Joule-Thomson coefficient [= $\partial T/\partial p_H$]; inductivity or absolute permeability; reduced mass [$1/\mu = (1/m_1) + (1/m_2)$]; molecular conductivity; gas amplification factor, photoelectric tube; amplification factor [= $-(\partial v_p/\partial v_0)i_p$]; chemical potential [$\partial G/\partial n$]; coefficient of friction; grid control ratio, thyratrons; (refractive index; coefficient of diffusion, fluid).
(μ_i)	Group refractive index.
μ_N	Nuclear magneton [= $\mu_0/1838$].
μ_B	Bohr magneton [= $eh/4\pi mc$].
μ_0	Coefficient of rolling friction.
μ_s	Coefficient of starting or static friction.
μ_k (μ_k)	Coefficient of sliding or kinetic friction.
μ_r	Relative magnetic permeability.
ν	Frequency, quantum theory of light; reluctivity [= $1/\mu$]; reciprocal of dispersive power; kinematic viscosity coefficient [= η/ρ].
ν_0	Photoelectric threshold frequency.
ν_∞	Rydberg's fundamental frequency*.
Ξ	Propagation flux density.
ξ	Longitudinal displacement, acous.
ξ, η, ζ	Displacement components of sound-bearing particle; generalized curvilinear coordinates; moving Cartesian axes coordinates.
Π	Osmotic pressure; Peltier coefficient; Poynting vector; continued product operator; Hertzian vector; reciprocal inductance.
"	Pressure, used for total pressure when p represents vapor pressure; (osmotic pressure).
ρ	Volume density of electric charge; reflectance or reflectivity or reflection factor [= F_r/F_i]; vapor density; resistivity or specific resistance; density [= m/V]; absolute humidity; radius of curvature; (mass per unit length; linear density [= m/l]; surface density [= m/A]).
ρ_i	Convection current.
ρ_s	Standard density, referred to $g_s = 980.665 \text{ cm sec}^{-2}$ at 0°C , 1A..
Σ	Exposure [= Et].
σ	Specific magnetization [= M/ρ]; coefficient of surface tension; surface density [= m/A]; effective molecular cross section; area; molecular diameter, collision; Poisson ratio; dispersion [= $dn/d\lambda$]; wave number; magnetic leakage coefficient; Stefan-Boltzmann constant [= J/T^4]; Thomson coefficient; electric conductivity [$I = \sigma E$]; surface charge density.
τ	Unit vector tangent to path.
τ	Coupling coefficient; optical transmittance or transmission factor [= F_t/F_i]; mean-life, radioactivity; modulus of decay [$s = A \cos(\omega t + \phi) \exp(-t/\tau)$]; time constant; dew-point temperature; (volume; time, used when t is used for temperature).
Φ	Dyadic in general.
Φ	Magnetic flux of induction [$\int \mathbf{B} \cdot d\mathbf{A}$]; magnetic flux [$\sim \int \mathbf{B} \cdot d\mathbf{A}$]; radiant power or flux [= dU/dt].
ϕ	Function; net work function per unit charge or electron affinity [$d\phi = dv/dq$ volts]; electromagnetic scalar potential; longitude; velocity potential, hydrodyn; fluidity, reciprocal of viscosity; angle between ray and normal in first medium; phase angle; (epoch angle).
ϕ_0	Gross work function per unit charge or gross electron affinity [$d\phi_0 = dv_0/dq$ volts].
ϕ_c	Critical angle.
ϕ'	Angle between ray and normal in second medium.
$\tilde{\phi}$	Polarizing angle or principal angle of incidence in dielectrics.
χ	Specific magnetic susceptibility [= k/ρ].

ABBREVIATIONS AND SYMBOLS (Continued)

Greek Letter Symbols (Continued)

Ψ	Planck function [$= -A/T$]; electric flux of induction [$= \int \mathbf{D} \cdot d\mathbf{A}$]; total flux of electric displacement [$= \int \mathbf{D} \cdot d\mathbf{A}$]; total electric flux [$= \int \mathbf{D} \cdot d\mathbf{A}$].
ψ	Time-dependent wave function; azimuth angle, optics.
$\overline{\psi}$	Principal azimuth angle.
Ω	Volume of phase space; ohm*.
$[\Omega]$	Relative molecular magnetic rotary power with reference to water*.
ω	Angular velocity.
ω	Pulsatance or periodicity; specific magnetic rotation or Verdet constant; dispersive power [$= (n_F - n_C)/(n_D - 1)$]; angular frequency of impressed force; angular frequency without damping; angular frequency, or periodicity or angular speed [$= 2\pi f$]; solid angle.
ω_r	Resonant periodicity.
ω'	Angular frequency of free vibration with damping.

Miscellaneous Symbols

\cdot (Superscripts)	Time derivatives, dots used over symbol.
$1/k$	Thermal resistivity.
$1/R$	Thermal conductance.

" " , specific heat, variation with temperature	1790
" " , transmissibility for radiations	2280

R

Radian, unit of angle, definition	2307
Radians—degree, conversion table	161-165
" " , logarithms of the trigonometric functions for angles in	136-137
" " , natural trigonometric functions for angles in	134-135
" " , to minutes and seconds, conversion table	164
Radiation, equation	2344
" " , Stefan-Boltzman law of, equation	2351
Radiations, wave lengths of	2071
Radicals, organic, prefix names of	575-579
Radii of atoms	2628-2630
Radioactive elements and their constants	313-356
" " substances, definition	2344
Radio formulae	2477-2487
" " tubes, base connections of	2519-2521
" " (vacuum) tubes, characteristics of	2496-2521
Radius for curvature from spherometer readings, equation	2344
" " gyration, definition	2344
Rainbows and halos, angular radius of	2626
Rankine scale of temperature, definition	2344
Raoult's law	2344
Ratio tables for bridge calculations	1963-1966
Reactions, electrochemical, potentials of, at 25°C	1418-1420
Reagents and solutions, special	1340-1349
" " , deci-normal solutions of	1368-1370
" " , for semi-micro qualitative analysis	1356-1357
" " , organic analytical	1359-1364
" " , preparation and concentration of	1335-1357
Receiving tubes, characteristics of	2496-2509
Recipes, laboratory	2525-2541
Reciprocal force, units and conversion factors	2390
" " units	2384
Reciprocals, numerical table	167-176
Recommended dietary allowances	1521-1522
Rectangle, area of, formula	258
Rectifiers, thermionic	2516-2519
Reducers, photographic	2574-2577
Reducing and oxidizing solutions	1353-1355

	PAGE
Velocity of sound, variation with temperature, equations	2357
" " water waves, equations	2357
" , units and conversion factors.. ..	2385
Verdet's constant.....	2301-2303; 2412
Vibrating strings, frequency of, equations.....	2326
Viscosity, definition, equation.....	1728; 2357; 2358
" of alcohol-water mixtures.....	1741
" " aqueous glycerol solutions for calibration.....	1742
" " sucrose	1741
" " gases.....	1736-1740
" " liquids.....	1730-1736
" " solids.....	1740
" " water.....	1728-1730
" , units and conversion factors.....	2399
Visibility, definition.....	2358
" , factors.....	2296-2297
" , relative, definition.....	2069
Vitamin unit table.....	1520
Vitamins, characteristics and functions of the.....	1514-1522
" , value of foods as sources of	1523-1536
Volt, unit of electromotive force, definition.....	2320
Voltage, calibration of spark-gap for.....	1938
Voltaic cells, electromotive force and composition of	1943-1944
" , internal resistance of.....	1948
Volume change due to fusion.....	1823
" , comparison of metric and English units	2416
" , English units, table.....	2365
" , metric units, table	2362
" , unit of, definition	2358
" , units and conversion factors.....	2369-2384
Volumes of regular solids, formulae.....	262-264
" , prismoidal formulae for	264
Volumetric analysis, standard solutions for.....	1350-1355
" primary standards.....	1365-1366
" quantitative reactions with gram equivalents, equations for	1371-1377
Von Ettinghausen's effect, definition	2322

W

W and $1/w^2$ values of (radio table).....	2491-2495
Washburn and Moen wire gauge	2591-2594
Water-Alcohol mixtures, boiling points of.....	1801
" analysis, conversion of units.....	1423
" at various temperatures, absolute density of	1694
" , boiling point of.....	1796-1797
" , density of.....	1690
" , index of refraction of	2226
" , relative density and specific volume of.....	1695
" , specific heat of.....	1765-1770
" , specific heat of, heavy.....	1782
" , surface tension, against air.....	1721
" , vapor in saturated air, mass of	1877-1887; 1912
" , pressure of.....	1825-1831
" , viscosity of.....	1728-1730
" waves, velocity of, equations	2357
Watt, unit of power, definition.....	2342
Wave length, electromagnetic.....	2487
" , frequency table for electromagnetic waves.....	2488-2490
" of the principal lines of the elements...2073-2142; 2145-2199	
" , secondary standards of.....	2200-2209
" lengths for spectroscopic calibration.....	2072
" of Fraunhofer lines.....	2072
" " various radiations.....	2071
" , primary standard, definition.. ..	2200
" , standard, in the ultraviolet.....	2208-2209
" motion, definition.....	2358
Wax, universal.....	2541

INDEX

	PAGE
Waxes and fats, constants of.....	1240-1245
Weighings, reduction to vacuo, equation	1367
" , " , table.....	1369
Weight, definition, equation, unit	2358
" or mass, comparison of metric and English units.. .	2419-2422
Weights and measures, metric system, tables	2361-2363
" , U. S. system, tables	2364-2368
Wet and dry bulb thermometer readings, reduction of	1924
Wheatstone's bridge, equation.....	2358
Wien's displacement law, equation.....	2358
Wire, cross-section and mass for copper, iron, brass and aluminum	2607-2610
" , dimensions, British standard gauge	2597
" , " , mass and resistance for copper.....	2599-2604
" , " , Stubs' gauge.....	2591-2594; 2596
" gauges, comparison of.....	2591-2594
tables.....	2591-2616
Wires, fusing currents for.....	2616
" , resistance per unit length.....	2611-2615
Wood stain, acid proof	2536
Woods, botanical and common names	1304 1307
" , physical properties of	1304 1307
Work, definition, equations	2358
" , units and conversion factors	2392; 2413
Written filters, transmission of	2269-2279

4

X-ray crystallographic data	2015–2068
“ developers, supplementary table	2063–2068
“ spectra	2564
“ spectra	2011–2014
X-rays, atomic absorption coefficients for	2010
“ mass absorption coefficients for	2005–2010

y

Yard, unit of length, definition	2333
" U. S. standard, metric equivalent for	2364
Yield point for metals, table,	1703-1707
Young's modulus, equations	2319
" , table	1708

 \mathbb{Z}

Zeeman effect, definition	2359
Zinc chloride, specific gravity of aqueous solutions	1645-1647
" nitrate	1648-1649
" sulfate	1650-1652

W 3208
